Part1 Introduction

1-1 Regarding "GHS Classification Guidance"

The “Globally Harmonized System of Classification and Labelling of Chemicals (GHS)” (hereinafter, abbreviated as UN GHS) was discussed in the UN for many years, and the Economic and Social Council held in July 2003 adopted a resolution to promote implementation of GHS worldwide, and individual countries are establishing systems to introduce GHS. In Japan, the government launched the GHS Inter-ministerial Committee1 in 2001, which began translating UN GHS-related documents into Japanese, exchanging information to establish GHS-related domestic laws, promoting the classification of substances in Japan, and implementing the GHS classification of substances requiring SDS under PRTR Law2, Industrial Safety and Health Law, Poisonous and Deleterious Substances Control Law, etc. (about 1500 substances) as references between FY 2006 and FY 2007, and published the classification results.

To facilitate GHS classification within a short period of two years, the committee established the “GHS Classification Manual,” which defines practical methods for data collection and evaluation criteria for data reliability, and the “Technical Guidance on GHS classification,” which defines detailed technical principles and judgment criteria on health hazards.

It has been pointed out that UN GHS documents include several parts for which individual countries can optionally select how to adapt GHS to its own system and to descriptions that are difficult to classify. Therefore, in FY 2007, the ministries and agencies concerned and the interested parties decided upon the Japanese principles for these parts based on the 2nd revised edition (2007) of UN GHS, while taking international harmonization into account, and worked to establish the Japanese Industrial Standard (JIS) for “Classification method of chemicals” based on “Globally Harmonized System of Classification and Labelling of Chemicals (GHS)” according to the principles from FY 2008. It was developed as JIS Z 7252-2009, Classification method of chemicals based on “Globally Harmonized System of Classification and Labelling of Chemicals (GHS)” in 2009. In this Guidance, JIS Z 7252 is referred to as “Classification JIS.” The Classification JIS is currently being revised, reflecting the update of the 4th revised edition of UN GHS, and is scheduled to be published within FY 2013.

---

2 “Act on Confirmation, etc. of Release Amounts of Specific Chemical Substances in the Environment and Promotion of Improvements to the Management Thereof”
The ministries and agencies concerned decided to begin classifying new chemicals utilizing the manual and technical guidance, however, a manual providing greater accuracy is required. Accordingly, the new and more accurate “GHS Classification Guidance” for the Japanese Government, which is consistent with the Classification JIS described above and an integrated “GHS Classification Manual” and “Technical Guidance on GHS Classification” that offer more convenience were produced. In July 2010, “GHS Classification Guidance” 2010 revised edition was published responding to the establishment of Classification JIS and the publication of the 3rd revised edition of UN GHS. This GHS Guidance FY 2012 revised edition reflects the 4th edition of UN GHS and the update of Classification JIS.

This GHS guidance is intended to help the ministries and agencies concerned carry out the GHS classification of applicable substances efficiently by offering classification methods and information sources so that the results of GHS classification by the ministries and agencies concerned are consistent. This GHS guidance is published in the name of GHS Inter-Ministerial Committee after its approval and the results of GHS classification are also revealed for reference.

For classification of mixtures, GHS Classification Guidance for Enterprises (FY 2012 Revised Edition) was created in accordance with UN GHS 4th Revised Edition and the update of Classification JIS.

This guidance is a manual based on Classification JIS, while providing for global harmonization, to allow GHS classification to be carried out correctly and effectively. It should be noted, however, that UN GHS includes classifications that are not adopted by Classification JIS, and this guidance includes original Japanese judgments and considerations unique to this guidance. (Regarding classifications that have not been adopted by Classification JIS, explanations are given where possible at the related part. Refer to them.)

It should be noted, however, that this guidance is designed for the effective implementation of the GHS classification, and hence requires a detailed investigation (checking original scientific papers, collection of new findings, hearing the views of experts, etc.) to achieve a more reliable classification.

Furthermore, this guidance may be amended, reflecting revisions to UN GHS, and as is considered reasonable, taking classification implementation status and efficiency, etc., into account, and based on a consensus of all parties concerned.

1st edition on March 2009
2nd edition on March 2010
3rd edition on August 2013
1-2 Method of describing classification results

(1) Regarding the description of classification results

In this guidance, the classification results for some substances are expressed as follows.

<table>
<thead>
<tr>
<th>Phrases used in classification results</th>
<th>Explanation</th>
<th>English terms in the original UN documents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification not possible</td>
<td>In case no data are available for classification after searching various information sources and in house data and the like or sufficient data for classification are not available.</td>
<td>Classification not possible</td>
</tr>
<tr>
<td>Not applicable</td>
<td>Substances outside the class since their physical properties do not meet the GHS definition. For example, considering a hazard class of &quot;XX solids, a substance whose normal state is liquid or gas is designated as “Not applicable.” When considering chemical structure, a substance not having chemical groups related to the evaluation items (Table 2-2-6-1, right columns) is also designated as “Not applicable.”</td>
<td></td>
</tr>
<tr>
<td>Not classified</td>
<td>Where sufficient information for classifying a substance is available, sufficient evidence was found to determine that it is not applicable to any hazard class defined by GHS through classification. In cases of a lack of sufficient information, &quot;Classification not possible&quot; should be chosen instead of &quot;Not classified&quot; but.</td>
<td>Not classified</td>
</tr>
</tbody>
</table>

Notes: Most classes of physical hazards in GHS are that of United Nations Recommendations on the Transport of Dangerous Goods (UNRTDG). Dangerous goods are to be transported in suitable containers. Risk is expressed for fire or leakage due to accidental damage to the container and the like. As a result, some hazard classes in UNRTDG classification involves only higher hazard levels without taking into account lower hazard levels.

Also, a substance with results outside the class obtained from test methods defined by UNRTDG is designated as “Not classified.” For example, in the classification of Oxidizing Solids, calcium nitrate tetrahydrate, cobalt nitrate hexahydrate, nickel nitrate, and strontium nitrate (anhydride) are illustrated not to be in Division 5.1 in the brochure of UNRTDG test methods, and they are considered to be “Not classified,” although they are oxidative materials.

Generally, substances judged as “Not classified” in GHS classification do not mean “Not hazardous” but mean that “No evidence of hazard was found to classify the substance into any hazard class.”
Furthermore, as stated in "3-2-1 Acute Toxicity", it should be noted that classification standard for GHS 4th revised edition and JIS Classification are not identical. For example, Acute Toxicity, Category 5 in the GHS 4th revised edition is classified as "Not classified" in the JIS Classification.

It should be noted that judgment criteria for the classification are not exactly the same between UN GHS and this guidance. Therefore, English terms in the original UN documents and Japanese terms in this guidance do not exactly correspond to each other.

(2) Points to remember when describing classification results

• When quoting an evaluation document as supporting evidence, use its abbreviation if available in the List.

• For the description of GHS classification results, the “GHS data input form” (GHS Inter-ministerial Committee, FY 2006) is helpful. Before describing, refer to the "Explanation of GHS hazard sheet." Both “GHS data input form” and “Explanation of GHS hazard sheet” are available from: National Institute of Technology and Evaluation
  http://www.safe.nite.go.jp/english/ghs_index.html

  “Supporting tool for GHS Classification” can be downloaded from the website of the National Institute of Technology and Evaluation

1-3 Workflow of GHS classification

*2: Refer to 4-2-1(3)(c) of this GHS Classification Guidance.
*3: Refer to 4-2-1(2) and 4-2-2(2).
Part2 Physical Hazards Guidance

2-1 Sources of information available for classification and judgment

The physical properties of substances, particularly the relationship between temperature and physical states, are one of the key factors for GHS classification. Equally important is information regarding physical hazards such as flammability, explosibility, combustion-supporting properties, and explosion limits. What follow are descriptions of literatures concerning the existing systems used as classification criteria and the useful sources of information.

2-1-1 Information directly applicable to GHS classification (Classification according to the United Nations Recommendations on the Transport of Dangerous Goods)

At present, progress is being made to the document that brought together classification results based on GHS. Since, however, the classification of physical hazards in GHS is based on that of the United Nations Recommendations on the Transport of Dangerous Goods (UNRTDG) (hereinafter abbreviated as UNRTDG classification) that has been utilized under an international consensus, the classification in GHS accords, in principle, with that of UNRTDG classification. However, as GHS classification includes dangerous goods whose transportation is prohibited (e.g., unstable explosives) and substances not applicable to dangerous goods in UNRTDG classification, some hazard classes (e.g., explosives, flammable gases, flammable liquids, self-reactive substances and mixtures, and organic peroxides) contain additional categories (Table 2-2-9-3).

The basic procedures of GHS classification are applying the GHS classification to a given substance on the basis of its physicochemical properties and designating its UNRTDG classification accordingly. As a result, it is often the case that UNRTDG classification of a substance is the only information source for practical physical hazards classification. Therefore, (1) UNRTDG can be utilized as database, and related literatures (2) and (3) may be used as complement.

(1) The United Nations Recommendations on the Transport of Dangerous Goods (UNRTDG)

The recommendations are presented by the UN Committee of Experts on the Transport of Dangerous Goods (CETDG/GHS), and have complementary contents. Therefore, it is appropriate to use them in GHS classification.

As of September 2012, the latest version is “UN Recommendations on the Transport of Dangerous Goods, Model Regulations, Seventeenth revised edition, 2011”.

A website (of the National Institute of Technology and Evaluation) posting UN numbers and TGD classification results for individual substances is given below. Preferably, the UN numbers and TGD classification results on the website are to be sufficiently confirmed:

http://www.safe.nite.go.jp/english/db.html

(2) The International Maritime Dangerous Goods Code (IMDG Code)

Regarding maritime transport, the International Maritime Organization (IMO) issues the International Maritime Dangerous Goods Code (IMDGC). As of September 2012, the IMDGC 2010 edition is the latest, and the classification is identical to that of (1).

This code is incorporated into the “Regulations for the Carriage and Storage of Dangerous Goods by Ship” of Japan (hereinafter abbreviated as the “Dangerous Goods Regulations”) (the 15th edition by Kaibundo, 2011). The UNRTDG classification is also adopted in the Aviation Law and its enforcement regulations, just like in the Dangerous Goods Regulations.

The website posting the Annex 1 of the Dangerous Goods Regulations: (Note that its content may lag behind that of the UN information)

http://law.e-gov.go.jp/htmldata/S32/S32F03901000030.html (Japanese text only)

Although the following literature is not directly related to GHS classification, it is used complementarily.

(3) The Emergency Response Guidebook (ERG)

Guidelines jointly developed by Canada, the U.S., and Mexico for those responding to land transport accidents.

The latest Japanese version is the 3rd revised edition of “Emergency Response Guidebook: Application to the Container Yellow Card Labeling System”, published in 2009 (Japan Chemical Industry Association). According to the Guidebook, Japan’s yellow cards are required to indicate one of the guide numbers 111-172.
2-1-2 Data collection systems of physical properties

For GHS classification, data on physical properties shall be searched from UNRTDG classification and the generally known database as shown in Figure 1-3-1.

Available databases for physical properties that can be used for this purpose are as follows.

For GHS classification of gases and low-temperature boiling liquids, information regarding various physical properties is important. In this section, databases for papers and abstracts that served as standard references for chemical researchers and engineers throughout the 20th century are first given in (1) – (4). In addition, databases on physical properties are indicated in (5) and (6) that have been useful especially for chemical engineers. Recent materials on physical properties of organic chemicals, including online databases, are introduced in (7) - (13).

For high-temperature boiling liquids, the information included in the hazard databases described in the next section is often sufficient, because their hazards are less affected by their physical properties.

In cases of solids, their degree of hazard often varies depending on their shape, particle size, surface state, etc., and, in general, each product should be measured and evaluated.

(1) Gmelins Handbuch der Anorganischen Chemie and Gmelin Handbook of Inorganic and Organometallic Chemistry 8th Ed (Gmelin)

They derive from “Handbuch der theoretischen Chemie”, a textbook written by Leopold Gmelin in 1817 for his lecture. The right to edit the textbook was transferred to the German Chemical Society in 1921, to develop it into a systematic book on inorganic compounds and organometallic compounds.

Publication of its 8th edition started in 1924 (from “zinc,” which had a system number of 32), and it grew into a huge series of about 300 volumes by 1998. The series has been published in English since 1982, and the latest digitized version is available in CD format.

(2) Beilsteins Handbuch der Organischen Chemie and Beilstein Handbook of Organic Chemistry 5th ed. (Beilstein)

These derive from the organic chemistry handbook in two volumes written by K. Beilstein (professor at the Imperial Technical Institute in St. Petersburg) in 1881 and 1882. Its 1st through 3rd editions were published by Beilstein, and, then, the right to edit the book was transferred to the German Chemical Society in 1896.

P. Jacobson and B. Prager jointly started the publication of the 4th edition in 1918. Subsequently, succeeding editors published supplementary volumes to the 4th edition throughout the 20th century.

The book started to be published in English from its 5th enlarged edition, published in 1960. It was digitized and provided in CD format in 1997.
(3) The Merck Index 14th Ed (Merck)
This is a manual for reagents and pharmaceutical materials first published in 1889 by Merck. The latest 14th edition is digitized and provides a search system utilizing the Web.

(4) Chemical Abstracts (CA)
This journal of abstracts has been edited by the American Chemical Society and published by the Chemical Publishing (now Chemical Abstracts Service) since 1907. It covers chemical literatures and patents worldwide, and includes not only material information but also all relevant information in theoretical chemistry and chemical technology. Every substance listed since 1907 was given a CAS number, retroactively, in September, 2002. It is now utilized primarily online, although its hard copies are still available.

(5) International Critical Tables of Numerical Data, Physics, Chemistry and Technology (ICT)
This database is compiled by the U.S. National Research of Council under the auspices of the International Research Council and the U.S. National Academy of Sciences. A total of 7 volumes were published by McGraw-Hill between 1926 and 1930, and their general index was released in 1933.

(6) Fluid Physical Properties Database for Engineers
This is a revised edition of the “Chemical Substance Constants,” which had been published by the Society of Chemical Engineers, Japan until 2003. Instead of providing the physical properties itself, it enables the search for the reference materials which are the source of the physical properties. It now includes a wider range of physical properties to cater for chemical technology and many other fields such as machine technology.

(7) Ullmanns Encyklopaedie der Technischen Chemie and Ullmann’s Encyclopedia: Industrial Organic Chemicals (Ullmann)
The 4th edition of Ullmann’s Encyclopedia of Industrial Chemistry, which was first published in the 1920s, was published by Verlag Chemie between 1972 and 1984. Volumes 1-7 provide a general introduction, and volumes 8-24, specifics about each substance. Volume 25 is an index. Wiley-VCH published the English version, in eight volumes, in 1999, focusing on organic base raw materials and intermediates.
It covers major chemical reactions, applications, and toxicity, with about 20 pages of description for each group of substances and excellent tables of physical properties.

(8) Handbook of Physical Properties of Organic Chemicals (about 13000 substances) (Howard)
This database of physical properties was compiled by P.H. Howard and W.M. Meylan (Syracuse Research Corporation) and published by Lewis in 1997. It addresses a total of about 13000 organic substances, arranged in order of their CAS numbers and contains data for eight parameters: melting point, boiling point (including boiling point under reduced pressure), aqueous solubility, octanol/water distribution coefficient, vapour pressure, dissociation constant, Henry coefficient, and reaction rate constant of hydroxyl radical in atmosphere.

(9) Chapman and Hall Chemical Database (Chapman) (442,257 records as of 1997)
This physicochemical database of organic compounds was originally called “HEILBRON” (a commercial database): http://library.dialog.com/bluesheets/html/bl0303.html

(10) CRC Handbook of Chemistry and Physics (CRC)
CRC publishes this handbook of physicochemical properties, and it is now in 93rd edition. Information in the book can be searched by CAS number.

(11) HODOC File (Handbook of Data on Organic Compounds) (HODOC)
(25580 substances as of 2008)
This is a database version of the CRC handbook.

(12) Sax’s Dangerous Properties of Industrial Materials (Sax)
Wiley-VCH Publishing has published this database of dangerous physical properties of industrialized products, and its 12th edition was published in 2012. Data on reactivity, combustibility and explosibility of approximately 28000 substances are listed. Information of the database can be searched by CAS number.

(13) Hazardous Substances Data Bank (HSDB)
This is a database compiled by the National Library of Medicine (NLM) of the U.S. Department of Health and Human Services, and it contains data on physicochemical properties as well. It is available in CD-ROM and is also searchable online. Search by CAS number is available. http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB

(14) eChem Portal (OECD)
This is the portal site of eChem OECD. Physicochemical data can be searched from the CAS number or the name of the substance.
http://www.echemportal.org/echemportal/index?pageID=0&request_locale=en

(15) Other
○Lange's Handbook of Chemistry 16th Ed. (2005)
2-1-3 Data collections of physicochemical hazard data

Scientific literatures focused on hazards of chemicals began to emerge in the latter half of the 20th century.

They addressed, however, emergency measures and risk management measures rather than listing hazard data, and they were filled with paragraphs on those topics and rating of hazards. They do not serve well in GHS classification especially for physical hazards. Accordingly, GHS classification is going to depend on UNRTDG classification described in 2-1-1 for the time being.

As some hazard databases include health hazard data, the ones that predominantly contain the descriptions of physical hazards are selected in this section.

Note that items (2) and (3), which focus on the reactivity between two substances that are outside the present GHS, are listed only for readers' reference.

(1) Hommel Handbook of Dangerous Goods (Hommel) (1205 substances)

(2) Bretherick’s Handbook of Reactive Chemical Hazards (7th edition) (Bretherick)

(3) Incompatible Hazard Handbook of Chemicals (2nd edition) (Tokyo Fire Department)

The first edition was supervised by Tadao Yoshida and Masamitsu Tamura and published by Nikkan Kogyo Shinbun in 1980, followed by the second edition in 1997. For each of more than 520 substances, around ten incompatible materials are ranked by the severity.

(4) Hazardous Chemicals Data Book (G. Weiss) and Solvents Safety Handbook (D. J. De Renzo) (Weiss)

The second edition of the former (covering 1016 substances) was published in 1986 by Noyes Data Corporation (the U.S.), from which the latter (covering 335 solvents) span off.

Data of each substance are given in one page in the former, while the latter provides another page with a table in which 7 properties for example temperature are compared. Since they are American books, they provide data in Fahrenheit, yards, and pounds.
(5) Dangerous Goods Data Book (Tokyo Fire Department)

The first edition was compiled by the Tokyo Consolidated Fire Prevention Association under the supervision of the Watch Committee of the Tokyo Fire Department and published by Maruzen in 1988, followed by the second edition covering 290 substances in 1993.

(6) Data Sheet of Dangerous Goods in Road Transport (the Research Institute for Safety Engineering)

This data sheet was published by the Research Institute for Safety Engineering in 1991 with the support of the three Public Highway Corporations. Its enlarged edition was published later, followed by the 1996 edition covering 322 substances.

(7) Chemical Substances Safety Data Book (The Chemical Substances Safety Information Workshop)

This data book, supervised by Yoichi Uehara, was first published by Ohmusha in 1994, followed by the 1997 revised and enlarged edition covering 582 substances.

(8) International Chemical Safety Cards (ICSC)

This database was developed by the International Program on Chemical Safety (IPCS). ILO is responsible for those parts of the database classifying physical hazards such as flashing point, ignition point, and explosion limit, and WHO is responsible for the parts covering health hazards. It is available in 16 different languages including English, Japanese, Chinese, Korean, German, Italian, French, and Russian.

At present, cards for about 1,700 substances are available, each of which can be searched by CAS number.

http://www.ilo.org/dyn/icsc/showcard.home

Japanese version: http://www.nihs.go.jp/ICSC/

This Fire Protection Guide was compiled by NFPA (the U.S. National Fire Protection Association). The 14th edition is now available, listing data on physical hazards such as flashing point, ignition point, and explosion limit, and individual substances can be searched by CAS number.

---

3 International Labour Organization
4 World Health Organization
The evaluation of physical hazards of Gases in GHS is based on the following ISO Standards. If there should be a conflict between description in ISO standards and that in the UN GHS, the one in ISO standards has precedence.

A) ISO 10156: 2010 Gases and gas mixtures – Determination of fire potential and oxidizing ability for the selection of cylinder valve outlets. (2010-04-01)

B) ISO 5145 Cylinder valve outlets for gases and gas mixtures – Selection and dimensioning. (2004-04-15)

Assessment methods for Oxidative gases and Flammable gases are described in A). In B), classification of gas substances is described, which is informative.

The first edition of this handbook was edited by the U.S. Compressed Gas Association and published by Kluwer Academic Publishers. In the 4th edition published in 1999, data of 45 Gases and Mixed Gases are listed.

This report (SIAP) is published by OECD and its Japanese version is published by the Japan Chemical Industry Ecology-Toxicology & Information Center. The SIDS report can be downloaded from: http://www.chem.unep.ch/irptc/sids/OECD/SIDS/sidspub.html. The Japanese version can also be downloaded from: http://www.jetoc.or.jp/safe/siap_top.html

This database is developed by the European Chemicals Agency (ECHA) and can be downloaded from http://esis.jrc.ec.europa.eu/index.php?PGM=dat

The following materials are not directly related to GHS classification and hence should be considered to be only for readers' reference.

This document is a collection of the label elements for dangerous substances listed in the European Inventory of Existing Commercial Chemical Substances (EINECS), and the label elements based on base-set results of new chemical substances. It contains qualitative descriptions with warning phrases and combined warning phrases.

The classification and categorization adopted in the Annex I of the EU Council Directive 67/548/EEC, which were relocated to Table 3-2, Annex VI of the CLP regulations after the establishment of CLP Regulations, cannot be used for reference as they are in GHS classification and categorization. The Japanese version of this document was published by JETOC in 2009 as “EU: List of Dangerous Substances (8th edition)”. The EU Council Directive 67/548/EEC is also referred to as the Dangerous Substances Directive (DSD).

In addition, in EU, GHS classification criteria and labeling regulations were introduced into its regulations on labeling and packaging by the CLP Regulation (“EU Regulation of the European Parliament and of the Council (EC) No. 1272/2008 on classification, labeling, and packaging of substances and mixtures) that entered into force in January 2009. In this guidance, it is referred to as EU CLP classification.

(2) Guidelines for Providing Information on the Safety of Chemical Substances (1993 Notice 1 from the Ministry of Labour, the Ministry of Health and Welfare, and the Ministry of International Trade and Industry)

These guidelines provide definitions of explosive substances, gases under pressure, flammable liquids, flammable solids/gases, pyrophoric substances, substances that emit flammable gases in contact with water, oxidizing substances, self-reactive substances, and corrosive substances. The guidelines can be compared with GHS classification and categorization. They were jointly issued by the Ministry of Labor, the Ministry of Health and Welfare, and the Ministry of International Trade and Industry on March 26, 1993 as Notice 1.
2-2 Classification of Physical Hazards based on physical, chemical states and chemical structure

2-2-1 Introduction
While there are 16 classes of GHS physical hazards at present, items to be evaluated can be reduced depending on the state of a substance (Gas, Liquid, and Solid). Some items cover substances with particular chemical structures only.

2-2-2 Definition of physicochemical state in GHS
In GHS, the state of a substance is defined, in general, under the temperature of 20°C and the atmospheric pressure of 101.3 kPa. Although these conditions are determined as internationally common rules, some substances cannot be dealt with under these conditions.

For example, phenol (melting point, 43°C) and 1,6-diaminohexane (melting point, 42°C) are designated as solids according to their GHS definition, but they are normally transported and stored heated in the melted state. The primary reason is that liquids can be more easily weighed and removed from a container to another than solids, and another reason is that they have risk to liquidize and leak during transport under high temperature, when they are contained in a box or a bag for solids.

2-2-3 Gases
Gases are defined as (i) substance whose vapour pressure exceeds 300 kPa (absolute) at 50°C or (ii) substance which is completely gaseous at standard atmospheric pressure (101.3 kPa) at 20°C, according to Chapter 1.2 in the 4th revised edition of UN GHS.

If they have a flammable range while mixed in air, they satisfy the criteria for “Flammable Gases” (2-3-2). When they contribute to the combustion of other material more than air does, they fall under “Oxidizing Gases” (2-3-4).

Gases which are contained in a receptacle at a pressure of 200 kPa (gauge pressure) or more for the purpose of supply, transport, storage, etc., or which are liquefied or liquefied and refrigerated fall under “Gases under Pressure” (2-3-5). The hazard class of “gases under pressure” do not have chemical hazards inherent to substances but have physical hazards entailed by the conditions of substances.

When flammable gases are used as propellants, aerosols are to be considered for classification as “flammable aerosols, Category 1 or 2” (2-3-3). Each aerosol product sample is tested individually because factors such as the structure of its nozzle affect combustibility/flammability. (When aerosols contain flammable liquids or flammable solids, their evaluation as “flammability, Category 1 or 2” is required, even if inflammable gases are used as propellants.) It should be noted that aerosol, a combined product, is outside the scope of the government’s classification.
2-2-4 Liquids

“Liquids” are defined as substances which at 50°C has a vapour pressure of not more than 300kPa (3bar), which is not completely gaseous at 20°C and at standard pressure (101.3kPa), and which has a melting point or initial melting point of 20°C or less at standard pressure (101.3kPa), according to 1.2 in the 4th revised edition of UN GHS. Highly viscous or pasty substances and mixtures, whose melting points cannot be determined, are tested according to ASTM D4359-90, or judged by the penetrometer test for specifying flowability defined by the section 2.3.4 in the Annex of the European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR).

Liquid substances are assessed to determine if they fall under “flammable liquids” (2-3-6), “pyrophoric liquids” (2-3-9), “self-heating substances and mixtures” (2-3-11), or “corrosive to metals” (2-3-16).

2-2-5 Solids

Any substances or mixtures that do not meet the definitions of “liquids” or “gases” are defined as “solids”, according to 1.2 in the 4th revised edition of UN GHS. Solids can be in various forms: powder, granule, paste, mass, fiber, tablet, etc. The hazards of powdered substance, for instance, may vary depending on their particle size. Therefore, hazards that a substance has in its current form, instead of hazards inherent to the substance, should be assessed.

Solid substances are assessed to determine if they fall under “flammable solids” (2-3-7), “pyrophoric solids” (2-3-10), “self-heating substances and mixtures” (2-3-11), and “corrosive to metals” (2-3-16).

2-2-6 Selection of assessment items according to chemical structure

When liquids and solids contain specific chemical groups in their molecules, an assessment should be conducted that takes into account the presence of those groups.

When they contain chemical groups related to explosibility (see 2-2-7), they shall be tested as “explosives” (2-3-1) and “self-reactive substances and mixtures” (2-3-8). When they contain chemical groups related to self-reactivity (see 2-2-8), they shall be tested as “self-reactive substances and mixtures” (2-3-8).

If they contain metals or semimetals (Si, Ge, As, Sb, Bi, etc.) in their molecules, they should be tested as “substances and mixtures which, in contact with water, emit flammable gases” (2-3-12).

Organic compounds containing oxygen, fluorine, or chlorine, any of which is bound to elements other than carbon and hydrogen, and inorganic compounds containing oxygen or halogen should be tested as “oxidizing liquids” (2-3-13) or “oxidizing solids” (2-3-14).

Organic compounds containing the –O–O– structure in their molecules, or mixtures containing
such compounds should be tested as “Organic Peroxides” (2-3-15).

The following table summarizes the above.

When a substance does not contain chemical groups mentioned in the column for “classifiable chemical structure” in Table 2-2-6-1, the “classification result” should be “not applicable”.

Example: “Not applicable” in the classification of “Organic Peroxides” (The substance in question is an organic compound not containing –O–O– structure.)

2-2-7 Chemical groups related to explosibility

【GHS 4th revised edition】 (2.1.4.2.2(a))

(a) There are no chemical groups associated with explosive properties present in the molecule.

Examples of groups which may indicate explosive properties are given in Table A 6.1 in Appendix 6 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria;

Examples of the chemical groups are as follows:

<table>
<thead>
<tr>
<th>Unsaturated C–C bond</th>
<th>Acetylenes, acetyldienes, 1,2–dienes</th>
</tr>
</thead>
<tbody>
<tr>
<td>C–metals, N–metals</td>

</tr>
<tr>
<td>O–halogen</td>
<td>Chlorates, perchlorates, iodosyl compounds</td>
</tr>
</tbody>
</table>

(UNRTDG: Manual of Tests and Criteria, Appendix 6, Table A6.1)

2-2-8 Chemical groups related to self-reactivity

【GHS 4th revised edition】 (2.8.4.2(a))

(a) There are no chemical groups present in the molecule associated with explosive or selfreactive properties; examples of such groups are given in Tables A6.1 and A 6.2 in the Appendix 6 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria;
Examples of the chemical groups are as follows:

<table>
<thead>
<tr>
<th>Inter-reacting group</th>
<th>Aminonitriles, haloanilines, organic salts of oxidizing acids</th>
</tr>
</thead>
<tbody>
<tr>
<td>S=O</td>
<td>Halogenated sulfonyl compounds, sulfonyl cyanides, sulfonyl hydrazides</td>

<td>Olefines, oxidized cyanides</td>
</tr>
</tbody>
</table>

(UNRTDG: Manual of Tests and Criteria, Appendix 6, Table A6.2)

2-2-9 Guidance for classification and examples of classification results indication

This section schematically explains guidelines for classification and illustrates classification results indication for 16 types of physical hazards. When you are actually engaged in classification, please refer to items on each hazard in sections 2-3.

(1) Judgment of Not applicable

A) A substance whose state is different from the definition of the relevant GHS hazard class or which does not meet the definition in terms of the chemical structure according to Table 2-2-6-1, shall be designated as “not applicable” with regard to that hazard class.

B) In case a substance meets conditions for a hazard class with higher priority:
Example: A substance that should be considered as “self-reactive substances and mixtures” contains explosive or self-reacting chemical groups and is classified as “explosives”, “organic peroxides”, “oxidizing liquids”, or “oxidizing solids.”

Example entry: Not applicable (classified as “explosives”)

A substance that should be considered as “self-heating substances and mixtures” is classified as either “pyrophoric liquids” or “pyrophoric solids.”

Example entry: not applicable (classified as “pyrophoric liquids”)

Table 2-2-9-1 shows example entries for grounds for classification of substances that are judged to be “not applicable” based on A) or B).

**(2) Judgment of Not Classified**

A substance subject to classification that obviously falls under none of the relevant hazard categories according to definitions in the 4th revised edition of UN GHS or its well-known physico-chemical properties (for example, “non-combustibility”) shall be classified as “not classified”. Example entries for the grounds for classification of substances judged as “not classified” are given in Table 2-2-9-2.

○ Supplement concerning Judgment of "not classified"

- Explosives

【GHS 4th revised edition】 (2.1.4.2.2)

(b) The substance contains chemical groups associated with explosive properties which include oxygen and the calculated oxygen balance is less than -200.

The oxygen balance is calculated for the chemical reaction:

\[ C_xH_yO_z + [x + (y/4)-(z/2)] O_2 \rightarrow x CO_2 + (y/2) H_2O \]

using the formula:

oxygen balance = -1600 \[2x +(y/2) -z\]/molecular weight;

(c) When the organic substance or a homogenous mixture of organic substances contain chemical groups associated with explosive properties but the exothermic decomposition energy is less than 500 J/g and the onset of exothermic decomposition to prevent the procedure being applied to a large number of organic materials which are not explosive but which will decompose
energy may be determined using a suitable calorimetric technique; or

(d) For mixtures of inorganic oxidizing substances with organic material(s), the concentration of the inorganic oxidizing substance is:
less than 15 %, by mass, if the oxidizing substance is assigned to Category 1 or 2;
less than 30 %, by mass, if the oxidizing substance is assigned to Category 3.

Self-reactive Substances and Mixtures

【GHS 4th revised edition】 (2.8.4.2)

(b) For a single organic substance or a homogeneous mixture of organic substances, the estimated SADT is greater than 75°C or the exothermic decomposition energy is less than 300 J/g. The onset temperature and decomposition energy may be estimated using a suitable calorimetric technique (see 20.3.3.3 in Part II of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria).

Flammable Liquids or Solids, Pyrophoric Liquids or Solids, Self-heating Substances and Mixtures

In the cases where the substance is confirmed to be noncombustible based on the information of the prescribed review document, enter “Not classified” for “Classification result” and “Non-combustibility” for “Classification Grounds and problems,” with regard to “Flammable Liquids or Solids”, “Pyrophoric Liquids or Solids”, and “Self-heating Substances and Mixtures”.

(Note) Flame-resistant substances are “not classified” either for those hazard classes, but the boundary between combustibility and flame-resistance is not clearly defined. Accordingly, in this classification, only if a substance is confirmed to be noncombustible based on the prescribed review document, enter "not classified" for “Classification result”.

(3) Categorization based on UNRTDG classification

Most of GHS physical hazards test (= UNRTDG test) results, except for certain data such as flashing point and explosion limit, are not published. If physical hazards data are not available from the prescribed review documents according to Figure 1-3-1 Classification Workflow, GHS judgment based on UNRTDG classification shall be made. Table 2-2-9-3 shows the correspondence between GHS and UNRTDG classifications.

</tbody>
</table>

* A Category which is inconsistent with that of GHS classification. Information is not sufficient enough to assign GHS classification based on the UN number and the UNRTDG class.

In the UNRTDG classification, individual substances were formerly assigned UN numbers, which can be used for GHS classification as they are.

In recent years, however, the generic entry system to assign UN numbers to a group of allied substances has been adopted to avoid UN numbers becoming enormous. Since UN numbers that were assigned to individual substances in the past remain, N.O.S. (not otherwise specified) is given to the allied group. UNRTDG classification shall be conducted by the consigner in principle, and there is no guarantee that the UNRTDG classification is carried out taking account of all possible risks. Therefore, UNRTDG classification of a substance assigned UN number with N.O.S. may not be applied to GHS classification.
When a substance (or mixture) presents more than one hazard, UNRTDG classification procedure sets the precedence order in hazard characteristics. Not all hazards of a substance are reflected in the UNRTDG classification.

Although a substance must be classified with regard to each individual hazard characteristic in the GHS classification procedure, some hazards only are reflected on the UNRTDG classification.

In the government’s GHS classification procedure, hazard characteristics that are not included in the UNRTDG classification are judged using their precedence.

In this guidance, the tables below are used for the judgment.

- UNRTDG Seventeenth revised edition (2011) 2.0.3 Precedence of hazard characteristics (P.53-54),
- IMDGC 2010 Ed. 2.0.3 Classification of substances, mixtures and solutions with multiple hazards (precedence of hazard characteristics) (P.41-42), or
- The “Dangerous Goods Regulations, Appendix 1, Recital 3” (see P.30).

[Substances classified into hazard class with the highest precedence]

As shown in “Dangerous Goods Regulations, Appendix 1, Recital 3,” explosives, self-reactive substances and mixtures, pyrophoric substances, and organic peroxides take precedence over others (as is the case with gases under pressure, these are separately assessed in GHS classification). Substances applicable to any of these hazard classes shall be assigned GHS classification with regard to their hazards according to Table 2-2-9-3.

Other hazards (e.g., flammable substances, self-heating substances and mixtures, substances and mixtures which, in contact with water, emit flammable gases, and oxidizing substances) shall be classified as “Classification not possible” unless otherwise “Not applicable” applies.

[Substances classified in other hazard classes: other than those with the highest precedence in classes 3, 4, and 5]

The order of precedence in hazard characteristics which are not applicable to those with the highest precedence shall be judged according to the table of Dangerous Goods Regulations, Appendix 1, Recital 3 on page 32.

Hazard classes having subcategories shall undergo GHS classification according to Table 2-2-9-3.

Unless a substance is classified as “Not applicable” with regard to hazard classes with the highest precedence, it shall be classified as “Not classified” with regard to explosives and self-heating substances and mixtures and as “Type G” with regard to self-reactive substances and mixtures and organic peroxides.

As for other hazard classes, unless a substance is classified as “Not applicable” with regard to the hazards listed high in the Table on page 32 it shall be classified as “Not classified,” and
classified as “Classification not possible” with regard to hazards listed low.

(Example 1) Azodicarbonamide (UN 3242) Division 4.1, Packing Group II

It is classified as Flammable solid, Category 2, in GHS classification.

According to the table of the Dangerous Goods Regulations, Annex 1, Recital 3 on page 32, since it is not classified in the higher precedence Division 4.2 or 4.3, it shall be labeled as “Not classified” with regard to self-heating substances and mixtures and those substances and mixtures which, in contact with water, emit flammable gases. With regard to oxidizing solids (Division 5.1), Packing Group I, what takes precedence is irrelevant, but Packing Groups II and III, which are of lower precedence, are classified as “Classification not possible.” However, it falls under “Not applicable” in light of its chemical structure, wherein oxygen binds to carbon and hydrogen only.

(Example 2) Zirconium nitrate (UN 2728) Division 5.1, Packing Group III

It is classified as Oxidizing Solids, Category 3.

According to the table on page 32, all divisions of Class 4 take precedence; it is judged as “Not classified” with regard to flammable solids, self-heating substances and mixtures, and substances and mixtures that, in contact with water, emit flammable gases.

[Utilization of subsidiary risks]

If a UNRTDG classification result includes a subsidiary risk, GHS classification may be estimated utilizing the table on page 32. It means that the substance has a hazard that has lower precedence than the primary hazard but so high as to be assigned to UNRTDG classification. It should be noted that Packing Group only involves primary hazards and, therefore, any subsidiary risks may not be specified.

(Example 3) Phosphorus pentasulfide (UN 1340), Division 4.3, Subsidiary risk 4.1, Packing Group II

It is classified as Substances and mixtures which, in contact with water, emit flammable gases, Category 2.

It corresponds to flammable solids from its subsidiary risk, but it can only be judged as “GHS Category 1 or 2” because its Packing Group can be II or III.

[Substances assigned Class 6 or 8]

Substances to which only toxicity and/or corrosivity are assigned in UNRTDG classification shall be dealt with as follows.

Unless a substance is “Not applicable” with regard to hazards of the highest precedence, it shall be classified as “Not classified” with regard to explosives, pyrophoric substances and mixtures, and as “Type G” with regard to self-reactive substances, mixtures and organic peroxide.

With regard to other hazards (e.g., flammable substances, self-heating substances, substances and mixtures that, in contact with water, emit flammable gases), a substance shall be classified as
“Classification not possible” in case it is not classified as “Not applicable,” regardless of the precedence level shown in the table on page 32. It shall be avoided to assign “Not classified” to hazard classes with the highest precedence. Substances having subsidiary risks shall be discussed later. Since testing of physical hazards and health hazards is generally carried out in different organizations, it cannot be guaranteed that both test results are compared with each other for judgment. Therefore, estimation of Class 6, 8 to Class 3, 4 and 5 is limited to substances having the highest precedence in the government’s classification work.

Packing Group information of Class 6 substances shall not be utilized for GHS classification in principle. The definition of Packing Group I, II, and III of Class 8 substances is identical to the skin-corrosive subcategories 1A, 1B, and 1C in GHS classification, whereas information about Class 8 in UNRTDG classification shall be used as reference information in principle.

In case a Class 6 or 8 substance mentioned before has Class 3 through 5 subsidiary risks, it shall be deemed to have undergone the test and evaluation of physical hazards, and “Not classified” shall be assigned to those listed high in the table on page 32 if the criteria of “Not applicable” are not met, and the category for subsidiary risks shall be assigned to those listed low.

(Example 4) Vinyl chloroacetate (UN number 2598), Division 6.1, Subsidiary risk 3, Packaging Group II
According to the table on page 33, “Packing Group III equivalent” could be only applicable to Class 3. It is estimated as Category 3 of Flammable liquids in GHS classification.

(Example 5) Thallium nitrate (UN number 2727), Division 6.1, Subsidiary risk 5.1, Packaging Group II
According to the table on page 33, only “Packing Group III” could be only applicable to Division 5.1. It is estimated as Category 3 of Oxidizing solids in GHS classification.
The “Dangerous Goods Regulations, Appendix 1, Recital 3”
If a substance is judged to meet the criteria for more than one hazard class or category, its class or category shall be determined as stipulated below.

(1) If a substance is judged to meet the criteria for any of the following hazard classes or categories, the class or category in question shall take precedence, and other classes or categories shall be deemed subsidiary.
   (i) Explosives,
   (ii) Gases Under Pressure,
   (iii) Combustible Substances (only when a substance is judged to meet the criteria of the Recital 2 (4) (ii) for Self-reactive substances)
   (iv) Pyrophoric Substances,
   (v) Organic Peroxides,
   (vi) Toxic Substances (only when the substance is judged to meet the criteria for Toxic substances of the Recital 2 (6) (i) of Packing Groups by inhalation toxicity of vaporizing substances)

(2) In cases other than (1), the following hazard class or category shall take precedence, and other class or category shall be subsidiary.

(3) If a substance is judged to meet the criteria for both of Flammable Gases Under Pressure and Toxic Gases Under Pressure, Toxic Gases Under Pressure shall take precedence, and Flammable Gases Under Pressure shall be subsidiary.

(4) The Packing Group shall be the one with the lowest numbering among Packing Groups.

Notes for the table in the next page are given below:
Note 1: The numbers in the table denote the following classes or categories.
- 3 Flammable Liquids
- 4.1 Combustible Substances
- 4.2 Pyrophoric Substances
- 4.3 Substances and mixtures which, in contact with water, emit flammable gases
- 5.1 Oxidizing Substances
- 6.1 Toxic Substances
- 8 Corrosives

Note 2: "I", "II" or "III" in the table each indicates the case where the Packing Group is judged to be I, II, or III, respectively.

Note 3: "Dermal", "oral", or "inhalation" in the table each indicates the case where the judging criteria is the Recital 2 (6) (i).

Note 4: "*" in the table indicates that the value in question shall be "6.1" for pesticides and
bactericides.

Note 5: "-" in the table indicates the absence of a given combination.

Note 6. The next Table is based on the "UN Recommendations on the Transport of Dangerous Goods, Model Regulations, 17th revised edition, 2011”. Note that the latest Table of the Dangerous Goods Regulations, Annex 1, Recital 3 has empty columns.

This Table is based on the "UN Recommendations on the Transport of Dangerous Goods, Model Regulations, 17th revised edition, 2011". Note that the underlined figures in this table are empty in the latest table of the Dangerous Goods Regulations, Appendix 1, Recital 3.
(4) Judgment of “Classification not possible”

As described above, a substance which is classified as neither “Not applicable” nor “Not classified” based on its state, chemical composition, chemical properties, etc., and cannot be classified based on literature data and UNRTDG classification shall be designated as “Classification not possible” since there is no data that should serve as the grounds for classification. Table 2-2-9-4 shows example entries for the grounds for classifying a substance as “Classification not possible”.

2-3 Classification and details of physical hazards

2-3-1 Explosives

(1) Definitions

Definitions of explosives in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.1.1)
2.1.1.1 An **explosive substance (or mixture)** is a solid or liquid substance (or mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases.

A **pyrotechnic substance (or mixture)** is a substance or mixture of substances designed to produce an effect by heat, light, sound, gas or smoke or a combination of these as the result of nondetonative self-sustaining exothermic chemical reactions.

An **explosive article** is an article containing one or more explosive substances or mixtures.

A **pyrotechnic article** is an article containing one or more pyrotechnic substances or mixtures.

2.1.1.2 The class of explosives comprises:

(a) Explosive substances and mixtures;

(b) Explosive articles, except devices containing explosive substances or mixtures in such quantity or of such a character that their inadvertent or accidental ignition or initiation shall not cause any effect external to the device either by projection, fire, smoke, heat or loud noise; and

(c) Substances, mixtures and articles not mentioned under (a) and (b) above which are manufactured with the view to producing a practical, explosive or pyrotechnic effect.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.1.2)
2.1.2.1 Substances, mixtures and articles of this class, which are not classified as an unstable explosive, are assigned to one of the following six divisions depending on the type of hazard they present:

(a) Division 1.1 Substances, mixtures and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire quantity present virtually instantaneously);

(b) Division 1.2 Substances, mixtures and articles which have a projection hazard but not a mass explosion hazard;

(c) Division 1.3 Substances, mixtures and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass
explosion hazard:
(i) combustion of which gives rise to considerable radiant heat; or
(ii) which burn one after another, producing minor blast or projection effects or both;

(d) Division 1.4 Substances, mixtures and articles which present no significant hazard:
substances, mixtures and articles which present only a small hazard in the event of ignition or initiation. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire shall not cause virtually instantaneous explosion of almost the entire contents of the package;

(e) Division 1.5 Very insensitive substances or mixtures which have a mass explosion hazard: substances and mixtures which have a mass explosion hazard but are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions;

(f) Division 1.6 Extremely insensitive articles which do not have a mass explosion hazard: articles which contain only extremely insensitive detonating substances or mixtures and which demonstrate a negligible probability of accidental initiation or propagation.

(3) Guidance for Classification

A) Judgment of Not applicable

1) If a substance falls under Gases, its “Classification result” shall be “Not applicable”, and indicate “a gas according to GHS definition” for “Classification Grounds and Problems”.  
2) If a substance does not contain chemical groups relating to explosibility, it shall be “Not applicable”, and indicate “It does not contain chemical groups relating to explosibility” for “Classification Grounds and Problems”.

B) Judgment of Not classified

For substances having explosive chemical groups including oxygen and falling under the provisions in the UN GHS 4th revised edition 2.1.4.2.2(b)-(d) (based on calculation result of oxygen balance, exothermic decomposition energy, and content of inorganic compounds), “Classification result” shall be “Not classified”, and “based on calculation result (calculated value: XX)” shall be indicated for “Classification Grounds” (do not assign “Not classified” only because of the result of oxygen balance calculation). In case oxygen balance is -144, a negative number, it shall be described as “Although oxygen balance is -144, higher than the criteria: -200,” instead of “oxygen balance is above -200,” because positive and negative number expression is sometimes confusing.

C) Classification based on UNRTDG Classification
1) Substances cited in (6) shall be classified according to the UNRTDG Classification.

2) Based on results of test series for UNRTDG Classification, “Desensitized Explosives” do not fall under Classes 1.1-1.6, and accordingly, not in “Explosives” in GHS either. For substances falling under “Desensitized Explosives”, regarding “Explosives”, “Classification result” shall be “Classification not possible”, and “Test method not determined” shall be indicated for “Classification Grounds”.

Test data under the “Explosives Control Law” or the “Fire Defense Law, Class 5 Dangerous Goods” both of which adopted test methods of the UN (although partially), may be used for classification after comparison with GHS test methods and close examination.

3) In UNRTDG classification, explosives take precedence over other hazards along with pyrophoric substances, self-reactive substances and mixtures, and organic peroxide. Therefore, if a substance has been classified as another lower hazard class (except N.O.S.), “Classification Result” can be “Not classified” with an indication for “Classification Grounds and Problems” that “It is classified in ○○, so considered to be not applicable to hazards of the highest precedence, “explosives”.”

(4) Data availability

The performance of explosives depends on their composition, and data regarding explosive performance of each substance are limited.

(5) Comparison with conventional classification systems

Divisions 1.1-1.6 in GHS, follow the definition of Divisions of UNRTDG 2.1.1.4.

(6) Sources of information for classification results under conventional systems

The UNRTDG list of dangerous goods (adopted into Annex 1: Dangerous Goods Regulations) includes the following substance.

· Unstable explosives: explosive substances and articles, whose transportation is prohibited.

The following explosives shown in 1979, the Ministry of Transportation Notice No. 549, “Notice to settle Transportation Standards and the like of Dangerous Goods by Ship”, Article 5 (1), are deemed as unstable explosives.

(a) AMMNONIUM BROMATE
(b) AMMNONIUM BROMATE SOLUTION
(c) AMMNONIUM CHLORATE
(d) AMMNONIUM CHLORATE SOLUTION
(e) AMMNONIUM CHLORITE
(f) AMMONIUM NITRATE (excluding those listed in Annex 1)
(g) AMMONIUM NITRITE
(h) Mixture of INORGANIC NITROUS ACID and AMMONIUM SALT
(i) SILVER PICRATE, WETTED with not less than 30% water, by mass
(j) CYCLOTRIMETHYLENETRINITRAMINE (CYCLONITE, RDX), WETTED with less than 15% water, by mass
(k) DIAZODINITROPHENOL, WETTED with less than 40% water, or mixture of alcohol and water, by mass
(l) DIETHYLENEGLYCOL DINITRATE, DESENSITIZED with less than 25% non-volatile, water-insoluble phlegmatizer, by mass
(m) GUANYLNITROSAMINO GUANYLIDENE HYDRAZINE, WETTED with less than 30% water, by mass
(n) GUANYLNITROSAMINO GUANYLTETRAZENE, WETTED with less than 30% water, or mixture of alcohol and water, by mass
(o) LEAD AZIDE, WETTED with less than 20% water, or mixture of alcohol and water, by mass
(p) LEAD STYPHNATE, WETTED with less than 20% water, or mixture of alcohol and water, by mass
(q) MANNITOL HEXANITRATE, WETTED with less than 40% water, or mixture of alcohol and water, by mass
(r) MERCURY FULMINATE, WETTED with less than 20% water, or mixture of alcohol and water, by mass
(s) NITROGLYCERIN, DESENSITIZED with less than 40% non-volatile water-insoluble phlegmatizer, by mass
(t) PENTAERYTHRITETETRANITRATE, WETTED with less than 25% water, by mass, DESSENSITIZED with less than 15% phlegmatizer, by mass
(u) POWDER CAKE, WETTED with less than 17% alcohol, less than 25% water, by mass
(v) CYCLOTETRAMETHYLENETETRANITRAMINE, WETTED with less than 15% water, by mass
(w) CYCLOTRIMETHYLENETRINITRAMINE AND CYCLOTETRAMETHYLENETETRANITRAMINE MIXTURE, WETTED with less than 15% water, by mass

**Division 1.6 = UNRTDG 1.6**

There is no article with a specific name that fall under this division.

**Desensitized explosives (GHS 2.1.2.2 Note 2)**

Some explosives which are wetted with water or alcohols, etc. to suppress their explosive properties do not meet the criteria for GHS Explosives. They are included in Class 3 and a part of Division 4.1 in UNRTDG, and they fall under the substance specified in Schedule 113 (Flammable Solids-Toxic substances (wetted/desensitized explosives) in ERG. They are F-E (Flammable...
Liquids not reacting with water) and S-J (wetted explosives and self-exothermic substances) in EmS.

e.g. UNRTDG 3 EmS:F-E

1204  NITROGLYCERIN SOLUTION IN ALCOHOL with not more than 1% nitroglycerin

2059  NITROCELLULOSE SOLUTION, FLAMMABLE with not more than 12.6% nitrogen, by dry mass, and not more than 55% nitrocellulose

UNRTDG 4.1 ERG113

1310  AMMONIUM PICRATE, WETTED with not less than 10% water, by mass

(UNRTDG 4.1 EmS:S-J)

1320  DINITROPHENOL, WETTED with not less than 15% water, by mass

1336  NITROGUANIDINE (PICRITE), WETTED with not less than 20% water, by mass

1337  NITROSTARCH, WETTED with not less than 20% water, by mass

1354  TRINITROBENZENE, WETTED with not less than 30% water, by mass

1355  TRINITROBENZOIC ACID, WETTED with not less than 30% water, by mass

1356  TRINITROTOLUENE, WETTED with not less than 30% water, by mass

1357  UREA NITRATE, WETTED with not less than 20% water, by mass

1571  BARIUM AZIDE, WETTED with not less than 50% water, by mass

2555  NITROCELLULOSE WITH WATER (not less than 25% water, by mass)

A substance which is a self-reactive substance or organic peroxide, Type B, has subsidiary risk 1 (Explosives) in UNRTDG. However, it shall be classified as “Classification not possible” if there are no test data on explosives provided by UNRTDG. It shall be noted that though it is assigned 1.3, by IMDG, they might have determined for convenience for isolation from other hazards in shipping. Therefore, it cannot be guaranteed that self-reactive substance, Type B, or organic peroxide, Type B, is classified as Explosives 1.3 as a result of the test.

(7) Classification of Explosives-related substances in other classes

If substances to be tested are solid, it involves a risk to perform tests with “desensitized explosives” for GHS “Flammable Solids” (the same tests for substances of UNRTDG Division 4.1, Packing group II, III). Therefore, if no information is available from prescribed review documents, the “classification result” shall be “Classification not possible”, and “Desensitized Explosives” shall be indicated for “Classification Grounds and Problems” regarding “Flammable Solids”. When, however, they are liquid and their measurement results of flashing point are available, classification for “Flammable Liquids” shall be carried out by utilizing the results. It should be
noted that classification and category are not defined for “desensitized explosives” at present.
2-3-2 Flammable Gases (including chemically unstable gases)

(1) Definitions
Definitions of flammable gases in UN GHS are as follows, and they are adopted in this guidance.

<table>
<thead>
<tr>
<th>GHS 4th revised edition</th>
<th>(2.2.1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A flammable gas</td>
<td>is a gas having a flammable range with air at 20°C and a standard pressure of 101.3 kPa.</td>
</tr>
<tr>
<td>A chemically unstable gas</td>
<td>is a flammable gas that is able to react explosively even in the absence of air or oxygen.</td>
</tr>
</tbody>
</table>

(2) Classification criteria in GHS

<table>
<thead>
<tr>
<th>GHS 4th revised edition</th>
<th>(2.2.2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A flammable gas is classified in one of the two categories for this class according to the following table:</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 2.2.1: Criteria for flammable gases</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>2</td>
</tr>
</tbody>
</table>

**NOTE 1**: Ammonia and methyl bromide may be regarded as special cases for some regulatory purposes.

**NOTE 2**: Aerosols should not be classified as flammable gases. See Chapter 2.3.

2.2.2.2 A flammable gas that is also chemically unstable is additionally classified in one of the two categories for chemically unstable gases using the methods that described in Part III of the Manual of Tests and Criteria according to the following table:
Table 2.2.2 Criteria for chemically unstable gases

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Flammable gases which are chemically unstable at 20°C and a standard pressure of 101.3 kPa</td>
</tr>
<tr>
<td>B</td>
<td>Flammable gases which are chemically unstable at a temperature greater than 20°C and/or a pressure greater than 101.3 kPa.</td>
</tr>
</tbody>
</table>

(3) Guidance for Classification

A) Judgment of Not applicable
   Chemicals which do not meet the GHS definition for gases shall be judged as “not applicable”.

B) Judgment of Not Classified
   Non-combustible and oxidative gases shall be judged as “not classified”.

C) Classification based on UNRTDG Classification
   Substances cited in (6) based on UNRTDG classification shall be classified according to it.

D) Classification based on data from prescribed literatures
   Classification shall be performed based on data of combustible range or explosion limit in prescribed review documents according to 2.2.2 Classification criteria of the UN GHS 4th revised edition.

(4) Data availability
   Physical properties of gaseous substances are relatively easy to obtain. All of combustible/flammable gases at ambient temperature and pressure shall be flammable gases. When data of combustible range (what is called explosive limit) are available, it is easy to pass a judgment for classification of a single gas.

(5) Comparison with conventional classification systems
   The definition of Division 2.1 described in UNRTDG 2.2.2.1 accords with that of GHS Category 1. It corresponds to Schedule F-D in EmS. S-U also includes toxic gases, etc. In ERG, the provisions for flammable gases are divided into Schedules 115, 116, 117, 118, and 119.
   In EU DSD classification, gaseous substances with R-Phrase \(5^1\)2(hereinafter, abbreviated as R12) meet these criteria (Categories 1 and 2), but no categorization is shown.

(6) Sources of information for classification results under conventional systems

---

For R-Phrase, see Appendix.
Category 1  = UNRTDG 2.1 and 2.3 (2.1)
Category 2  = Flammable gas which is not included in Category 1

Only flammable gases in such a state (compressed or liquefied) that meets definitions of gases under pressure described in 2-3-5 are subject to the “Class 2, Gases” in UNRTDG.

In GHS, “flammable gases” may include gases with ambient pressure because of the omission of the condition of gases under pressure.

(7) Classification criteria of chemically unstable gases

“Chemically unstable gases” is a hazard class newly added to GHS 4th revised edition (2011). It is added to the hazard class of Flammable gases as chemically unstable gases and additionally classified as Category A or B.

GHS 4th revised edition only indicates that the test methods are described in Part III of the Manual of Tests and Criteria of UNRTDG. However, no description about it was found in its 5th revised edition (2009). In 2011, supplementary volumes to the 5th revised edition were published, and the test methods of chemically unstable gases were added as Part III Section 35. These are such newly determined test methods that information currently available is limited to the descriptions of the Manual of Tests and Criteria, Part III, section 35 of UNRTDG. The point is as follows:

1) A chemically unstable gas is a flammable gas that is able to react explosively even in the absence of air or oxygen. (Therefore, a mixture of oxygen and flammable gas stipulated in Chapter 5 of ISO 10156:2010 shall not be deemed chemically unstable from the perspective of this test method.)
2) Functional groups that represent chemical instability in gases include triple bond, adjacent or conjugated double bond, halogenated double bond, and strained ring. (Flammable gases which do not include any of these are not considered chemically unstable, but expert judgment is needed for final decision.)

3) The test for Category A shall be performed at ambient temperature and pressure. If the test gas shows a given pressure rise in the test, it is classified in Category A.

4) Further tests at 65°C and the corresponding initial pressure shall be performed for the gas that has not been classified in Category A in the test. If the test gas shows a given pressure rise, it shall be classified in Category B. The 4th revision of GHS indicates only “a pressure above 101.3kPa and/or above 20°C”. By the Amendment 1 (2011) of Manual of Tests and Criteria, UNRTDG, it has been decided that the test is performed at 65°C. The corresponding initial pressure means the internal pressure of a high-pressure gas cylinder at 65°C. For liquefied test gases, the corresponding initial pressure is the vapour pressure at 65°C.

5) Table 2-3-2-1 shows information about chemically unstable gases that is described in Table 35.1 of the Manual of Tests and Criteria, Part III, section 35 of UNRTDG. (Judgment method of gas mixtures is not a subject of the guidance for the government, so it is not mentioned herein.)

Table 2-3-2-1: Test result of chemically unstable gases (UNRTDG Test Manual Sec.35 (2011))

GHS classification criteria

1) Substances other than flammable gases do not require any description about chemical instability.

2) Flammable gases which do not contain any functional group representing chemical instability shall be classified in “Category 1” or “Category 2” only with the indication for “Classification Grounds and Problems” that “No functional group that represents chemical instability is contained.”

3) As for substances shown in Table 2-3-2-1, category shall be assigned in addition to the hazard class: Flammable gases with the indication that “Test result is available in UNRTDG Test Manual (2011)” for “Classification Grounds and Problems.”

4) Flammable gases which contain a functional group that represents chemical instability but are not listed in Table 2-3-2-1 shall be classified in “Category 1” or “Category 2” only with the indication for “Classification Grounds and Problems” that “Functional group that represents chemical instability is contained, but no information about the test results were available.”

5) In case the results of the test performed in accordance with the UNRTDG Test Manual Sec. 35 are obtained from another source than the UNRTDG Test Manual, it can be adopted.
2-3-3 Aerosols

(1) Definitions

Definitions of flammable of aerosols in UN GHS are as follows, and they are adopted in this guidance.

Aerosols, this means aerosol dispensers, are any non-refillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.

(2) Classification criteria in GHS

Aerosols should be considered for classification as flammable if they contain any component which is classified as flammable according to the GHS criteria, i.e.:

- Flammable liquids (see Chapter 2.6);
- Flammable gases (see Chapter 2.2);
- Flammable solids (see Chapter 2.7).

NOTE1: Flammable components do not cover pyrophoric, self-heating or water-reactive substances and mixtures because such components are never used as aerosol contents.

NOTE2: Aerosols do not fall additionally within the scope of chapters 2.2 (flammable gases), 2.5 (gases under pressure), 2.6 (flammable liquids), and 2.7 (flammable solids). Depending on their contents, aerosols may however fall within the scope of other hazard classes, including their labeling elements.

A flammable aerosol is classified in one of the three categories for this Class on the basis of its components, of its chemical heat of combustion and, if applicable, of the results of the foam test (for foam aerosols) and of the ignition distance test and enclosed space test (for spray aerosols). See decision logic in 2.3.4.1. Aerosols which do not meet the criteria for inclusion in Category 1 or Category 2 (extremely flammable or flammable aerosols) should be classified in Category 3 (nonflammable aerosols).

(2.3.4.1 Decision logic)

To classify an aerosol as a flammable aerosol, data on its flammable components, on its chemical heat of combustion and, if applicable, the results of the foam test (for foam aerosols) and of the ignition distance test and enclosed space test (for spray aerosols) are required.
The GHS classification criteria are summarized as follows:

Category 1:
- Aerosols whose content of flammable components is 85% or more and whose heat of combustion is 30 kJ/g or larger, or
- Spray aerosols for which ignition occurs at a distance of 75 cm or more in the flame distance (ignition distance) test, or
- Foam aerosols which have, in the foam test, 20 cm or more of the flame height and 2 seconds or longer of the flame duration or have 4 cm or more of the flame height and 7 seconds or longer of the flame duration,

Category 2:
- Spray aerosols for which the heat of combustion is 20 kJ/g or larger and either for which ignition occurs at a distance of 15 cm or more in the flame distance (ignition distance) test or for which the time equivalent is 300 second/m³ or less, or the deflagration density is 300 g/m³ or less, in the enclosed space ignition test,
- Foam aerosols which have, in the foam test, 4 cm or more of the flame height and 2 seconds or longer of the flame duration,

Category 3:
- Aerosols whose content of flammable components is 1% or less and the heat of combustion is smaller than 20 kJ/g, or
- Spray aerosols which are not classified in Category 1 or 2 in the enclosed space ignition test
- Foam aerosols which are not classified in Category 1 or 2 in the foam test

(3) Guidance for Classification

A) Judgment of “Not applicable”

For substances to undergo the government classification procedure, classification result of aerosols shall be “Not applicable”, and “Not an aerosol product” shall be indicated for “Classification Grounds and Problems”.

B) Judgment of “Category 3”

A product which contains no flammable components, or a containing 1% or less flammable components and whose heat of combustion is smaller than 20 kJ/g shall be classified as “Category 3.”

(4) Data availability

The composition of an aerosol product is determined by its product designer. The categories of spray solutions and propellant gases should be determined according to the decision logic in GHS 2.3.4.1 with necessary test, if any.

(5) Comparison with conventional classification systems

A judging method described in the Special provision 63 for UN number 1950 (Aerosols) in
UNRTDG 3.2.1 Dangerous Goods List has been adopted to the GHS decision logic.
2-3-4 Oxidizing Gases

(1) Definitions

Definitions of oxidizing gases in UN GHS are as follows, and they are adopted in this guidance.

<table>
<thead>
<tr>
<th>GHS 4th revised edition</th>
<th>(2.4.1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>An oxidizing gas is any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** “Gases which cause to the combustion of other material more than air does” means pure gases or gas mixtures with an oxidizing power greater than 23.5% as determined by a method specified in ISO 10156:2010.

(2) Classification criteria in GHS

<table>
<thead>
<tr>
<th>GHS 4th revised edition</th>
<th>(2.4.2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>An oxidizing gas is classified in a single category for this class according to the following table:</td>
<td></td>
</tr>
</tbody>
</table>

Table 2.4.1: Criteria for oxidizing gases

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.</td>
</tr>
</tbody>
</table>

(3) Guidance for Classification

A) Judgment of Not applicable

Chemicals which do not meet the GHS definition of gases shall be judged as “Not applicable”.

B) Classification based on UNRTDG Classification etc

The substance to be evaluated that is listed as a dangerous good (a gas product whose division number of for its subsidiary risk is 5.1) in the Dangerous Goods List based on UNRTDG classification shall belong to “Category 1”.

As for the following gases described in ISO10156-2010, Table 3, a pure gas shall be classified in “Category 1.”

- Bis-trifluoromethylperoxide  \( C_i = 40 \)  (Note) \( C_i \): Oxygen equivalency coefficient
- Bromine pentafluoride  \( C_i = 40 \)
- Bromine trifluoride  \( C_i = 40 \)
- Chlorine  \( C_i = 0.7 \)
- Chlorine pentafluoride  \( C_i = 40 \)
- Chlorine trifluoride  \( C_i = 40 \)
- Fluorine  \( C_i = 40 \)
- Iodine pentafluoride  \( C_i = 40 \)
<table>
<thead>
<tr>
<th>Compound</th>
<th>C_i</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nitric oxide</td>
<td>0.3</td>
</tr>
<tr>
<td>Nitrogen dioxide</td>
<td>1</td>
</tr>
<tr>
<td>Nitrogen trifluoride</td>
<td>1.6</td>
</tr>
<tr>
<td>Nitrogen trioxide</td>
<td>40</td>
</tr>
<tr>
<td>Nitrous oxide</td>
<td>0.6</td>
</tr>
<tr>
<td>Oxygen difluoride</td>
<td>40</td>
</tr>
<tr>
<td>Ozone</td>
<td>40</td>
</tr>
<tr>
<td>Tetrafluorohydrazine</td>
<td>40</td>
</tr>
</tbody>
</table>

For reference: in 2005, global test methods on “oxidizing gases” were established as ISO 10156-2, whose revision ISO 10156:2010 is currently effective. Because this test requires an immense amount of time and effort and involves risk of explosion, the measurement results for coefficient of oxygen equivalency have been obtained only for a few substances before the establishment of the ISO. Oxidizing gases for which measurement has not been performed shall be C_i = 40 for safety reasons.

C) Judgment of Not Classified

Other (non-oxidizing) gases than described above shall be judged as “Not classified”. “Oxidizing gases” cannot be classified in “Not classified” for the reason that “it does not contain oxygen.” Halogenated gas is also applicable to oxidizing gases.

(4) Data availability

The coefficients of oxygen equivalency of nitrous oxide (0.6) and oxygen (1) are described in the GHS 4th revised edition. Toxic/corrosive oxidizing gases, which are described in the ISO-10156-2010, are all listed on the above (3) B).

(5) Comparison with conventional classification systems

The UNRTDG definition (UNRTDG 2.5.2) for oxidizing substances (Division 5.1) is limited to liquids and solids. In UNRTDG, there are no classification criteria for classification or categorization of oxidizing gases. Gases having Division 5.1 subsidiary risk apply; they are considered not exhaustive. Oxidizing gases fall under Schedule 122 in ERG and S-W in EmS, on the basis of which oxidizing gases can be selected.

(6) Sources of information for classification results under conventional systems

Gases classified as Division 2.2(5.1), 2.3(5.1), and 2.3(5.1, 8) in the third and forth columns of the UNRTDG Dangerous Goods List fall under this class. In addition, some of gases classified as Division 2.2 and 2.3 can fall under “oxidizing gases” even if their subsidiary risks are not specified.

For transport of dangerous goods, only those classified as “Gases under Pressure” are subject to
regulation, while gases with ambient pressure are also included in the GHS class because of the absence of such conditions in GHS.

(Example) UNRTDG 2.2 (5.1)

1003  AIR, REFRIGERATED LIQUID
1014  CARBON DIOXIDE AND OXYGEN MIXTURE, COMPRESSED
1070  NITROUS OXIDE
1072  OXYGEN, COMPRESSED
1073  OXYGEN, REFRIGERATED LIQUID
2201  NITROUS OXIDE, REFRIGERATED LIQUID
2451  NITROGEN TRIFLUORIDE

UNRTDG 2.3 (5.1, 8) or UNRTDG 2.3 (5.1)

1045  FLUORINE, COMPRESSED
1067  DINITROGEN TETROXIDE (NITROGEN DIOXIDE)
1660  NITRIC OXIDE, COMPRESSED
1749  CHLORINE TRIFLUORIDE
1975  NITRIC OXIDE AND DINITROGEN TETROXIDE MIXTURE (NITRIC OXIDE AND NITROGEN DIOXIDE MIXTURE)
2190  OXYGEN DIFLUORIDE, COMPRESSED
2421  NITROGEN TRIOXIDE
2548  HALORINE PENTAFLUORIDE
2901  BROMINE CHLORIDE
3083  PERCHLORYL FLUORIDE
2-3-5 Gases Under Pressure

(1) Definitions

Definitions of gases under pressure in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.5.1)

Gases under pressure are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more, or which are liquefied or liquefied and refrigerated.

They comprise compressed gases, liquefied gases, dissolved gases and refrigerated liquefied gases.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.5.2)

Gases under pressure are classified, according to their physical state when packaged, in one of four groups in the following table:

Table 2.5.1: Criteria for gases under pressure

<table>
<thead>
<tr>
<th>Group</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressed gas</td>
<td>A gas which when packaged under pressure is entirely gaseous at -50 °C; including all gases with a critical temperature ≤ -50 °C.</td>
</tr>
</tbody>
</table>
| Liquefied gas     | A gas which when packaged under pressure, is partially liquid at temperatures above -50 °C. A distinction is made between:
|                   | (a) High pressure liquefied gas: a gas with a critical temperature between -50°C and +65°C; and |
|                   | (b) Low pressure liquefied gas: a gas with a critical temperature above +65°C.          |
| Refrigerated liquefied gas | A gas which when packaged is made partially liquid because of its low temperature. |
| Dissolved gas     | A gas which when packaged under pressure is dissolved in a liquid phase solvent. |

The critical temperature is the temperature above which a pure gas cannot be liquefied, regardless of the degree of compression.

*NOTE:* Aerosols should not be classified as gases under pressure. See Chapter 2.3.

(3) Guidance for Classification

A) Judgment of Not applicable

Substances and mixtures that are liquid or solid according to the GHS definition shall be judged
as “Not applicable”.

B) Classification based on data from prescribed literatures

In GHS hazard classes of gas, “gases under pressure” are conditions made in the pressure vessels by manufacturers depending on their purposes such as transport and use. And other properties (flammable gases, oxidizing gases, acute inhalation toxicity) are based on hazards when these gases exist in air at a standard pressure.

In the new GHS classification, “gases under pressure” are categorized into individual groups depending on critical temperatures obtained, in principle, from prescribed review documents and conditions assumed during transport.

If the gas under pressure is a single substance, categories of refrigerated liquefied gas and dissolved gas are not applied.

(4) Data availability

The data required are vapour pressure at 50 °C physical properties at 20 °C and atmospheric pressure, and critical temperature (GHS2.5.4.2). All of them can be obtained relatively easily. The government’s classification procedure shall not take into account the state of gases when compressed in cylinder and the pressure, etc., which depends on the design of manufacturers.

(5) Comparison with conventional classification systems

The definition of Class 2 (gas)set out in UNRTDG 2.2.1.2 accords with that of gas in GHS: “a substance that at 50 °C has a vapour pressure greater than 300 kPa (absolute pressure); or is completely gaseous at 20 °C at a standard pressure of 101.3 kPa”. On the other hand, UNRTDG does not provide the definition of “gases under pressure”, which are newly defined by GHS as “gases with vapour pressure of 200 kPa or more”.

(6) Sources of information for classification results under conventional systems

These depend on the design selected by the manufacturers. Categorization of Gases under Pressure is performed by using external data as complement.
2-3-6 Flammable Liquids

(1) Definitions

Definitions of flammable liquids in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.6.1)
A flammable liquid means a liquid having a flash point of not more than 93 °C.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.6.2)
A flammable liquid is classified in one of the four categories for this class according to the following table:

Table 2.6.1: Criteria for flammable liquids

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flash point &lt; 23°C and initial boiling point ≤ 35°C</td>
</tr>
<tr>
<td>2</td>
<td>Flash point &lt; 23°C and initial boiling point &gt; 35°C</td>
</tr>
<tr>
<td>3</td>
<td>Flash point ≥ 23°C and ≤ 60°C</td>
</tr>
<tr>
<td>4</td>
<td>Flash point &gt; 60°C and ≤ 93°C</td>
</tr>
</tbody>
</table>

NOTE 1: Gas oils, diesel and light heating oils in the flash point range of 55 °C to 75 °C may be regarded as a special group for some regulatory purposes.

NOTE 2: Liquids with a flash point of more than 35 °C may be regarded as non-flammable liquids for some regulatory purposes (e.g. transport) if negative results have been obtained in the sustained combustibility test L.2 of Part III, section 32 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria.

NOTE 3: Viscous flammable liquids such as paints, enamels, lacquers, varnishes, adhesives and polishes may be regarded as a special group for some regulatory purposes (e.g. transport). The classification or the decision to consider these liquids as non-flammable may be determined by the pertinent regulation or competent authority.

NOTE 4: Aerosols should not be classified as flammable liquids. See Chapter 2.3.

(3) Guidance for Classification

A) Judgment of Not applicable

Substances and mixtures that are gases and solids shall be judged as “Not applicable”.

B) Judgment of Not Classified

Incombustible Liquids shall be judged as “Not classified” (Hazardous Materials in the category IV of the Fire Service Act, class IV petroleums, oil extracted from animals plants shall also be deemed as “Not classified”). Furthermore, flame-resistant substances are considered as
“Not classified” with regard to these classes, but the boundary between combustibility and flame-resistance is not clearly defined. Accordingly, in this classification, only if a substance is confirmed to be noncombustible based on the prescribed review documents, “Classification result” shall be “Not classified”; an example of “Classification Grounds and Problems” may be indicated as “Incombustible (title of the review document, year of publication)” (See Table 2-2-9-2.)

C) Classification based on data from prescribed literatures

Regarding GHS classification of flammable liquids, categories based on flash points obtained from the prescribed review documents shall take precedence, and classification based on UNRTDG shall be adopted only when flash points data are not available.

Since Category 4 of flammable liquids in GHS classification does not fall under Dangerous Goods in UNRTDG classification, as for Category 4, UNRTDG classification results cannot be used for GHS classification.

(4) Data availability

Since such measurements are obligatory under the Fire Service Act, data can be obtained relatively easily even for articles. However, the law requires the “open-cup method” for the measurement of high flash points, which poses a problem around the upper limit of Category 4.

(5) Comparison with conventional classification systems

In general, Categories 1-3 accords with Class 3 of UNRTDG.
Category 1 = UNRTDG 3 I (No upper limits are provided for flash points, but no combustible substance with an initial boiling point of 35°C and lower and a flash point of 23°C or higher has been reported.)
Category 2 = UNRTDG 3 II
Category 3 = UNRTDG 3 III
Category 4 = They are non-dangerous articles in UNRTDG.

The categories of EU DSD classification differ from that of GHS (R12, 11, and 10 only serve as reference).

(6) Sources of information for classification results under conventional systems

Relevant Laws and regulations according to the suitable UNRTDG, such as the Dangerous Goods Regulations (Japan), can be applied to Categories 1, 2, and 3, through the procedures described in the previous section.

(Example of category 1) UNRTDG 3 I
1093    ACRYLONITRILE, STABILISED
1131    CARBON DISULPHIDE
2481    ETHYL ISOCYANATE

(Example of category 2) UNRTDG 3 II
1090    ACETONE
1154    DIETHYLAMINE
1717    ACETYL CHLORIDE
1230    METHANOL

(Example of category 3) UNRTDG 3 III
1157    DIISOBUTYL KETONE
2260    TRIPROPYLAMINE
2529    ISOBUTYRIC ACID

(Example of category 4) DIVINYLBENZENE
N-ETHYL ANILINE
ETHYLENE CYANOHYDRIN
NITROBENZENE
2-3-7 Flammable Solids

(1) Definitions

Definitions of flammable solids in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(2.7.1)

A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction.

Readily combustible solids are powdered, granular, or pasty substances which are dangerous if they can be easily ignited by brief contact with an ignition source, such as a burning match, and if the flame spreads rapidly.

(2) Classification criteria in GHS

【GHS 4th revised edition】(2.7.2)

2.7.2.1 Powdered, granular or pasty substances or mixtures shall be classified as readily combustible solids when the time of burning of one or more of the test runs, performed in accordance with the test method described in the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, Part III, sub-section 33.2.1, is less than 45 s or the rate of burning is more than 2.2 mm/s.

2.7.2.2 Powders of metals or metal alloys shall be classified as flammable solids when they can be ignited and the reaction spreads over the whole length of the sample in 10 min or less.

2.7.2.3 Solids which may cause fire through friction shall be classified in this class by analogy with existing entries (e.g. matches) until definitive criteria are established.

2.7.2.4 A flammable solid is classified in one of the two categories for this class using Method N.1 as described in Part II I, sub-section 33.2.1 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, according to the following table:
Table 2.7.1: Criteria for flammable solids

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| 1        | Burning rate test:  
  Substances or mixtures other than metal powders:  
  (a) wetted zone does not stop fire; and  
  (b) burning time <45 s or burning rate >2.2 mm/s  
  Metal powders: burning time ≤5 min |
| 2        | Burning rate test:  
  Substances or mixtures other than metal powders:  
  (a) wetted zone stops the fire for at least 4 min; and  
  (b) burning time <45 s or burning rate >2.2 mm/s  
  Metal powders: burning time >5 min and ≤10 min |

**NOTE 1:** For classification tests on solid substances or mixtures, the tests should be performed on the substance or mixture as presented. If for example, for the purposes of supply or transport, the same chemical is to be presented in a physical form different from that which was tested and which is considered likely to materially alter its performance in a classification test, the substance must also be tested in the new form. **NOTE 2:** Aerosols should not be classified as flammable solids. See Chapter 2.3.

(3) Guidance for Classification

A) Judgment of Not applicable
Substances and mixtures that are gases and liquids shall be judged as “Not applicable”.

B) Judgment of Not Classified
Solids known to be non-combustible or flame-resistant by literatures shall be “Not classified”.

C) Classification based on UNRTDG Classification
If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, “Classification not possible” is applied to it in principle.

(4) Data availability
Few result values of the rate-of-burning tests have been published.

(5) Comparison with conventional classification systems
Flammable solids accord with Division 4.1 of UNRTDG.
Division 4.1 also includes 2-3-8 “Self-reactive Substances and Mixtures” and 2-3-1 “Desensitized explosives.” Therefore, ERG should be also considered.
Related ERG Schedules are as follows:
133 Flammable Solid
134 Flammable Solid – toxic/corrosive
170 Metal  (powder, dust, shavings, drilling chips, lathe chips, swarf, etc.)

In EmS, “Flammable Solid” is included in Schedule S-G along with “Self-reactive Substances”. These classification criteria are also applied to the solids of R11 in EU DSD classification.

(6) Sources of information for classification results under conventional systems

Those categories below of UNRTDG (or Dangerous Goods Regulation of Japan) can be applied.

Category 1 = UNRTDG • 4.1 II ERG133, 134, 170
Category 2 = UNRTDG • 4.1 III ERG133, 134, 170

(Example of category 1)

<table>

|             | 2878  | TITANIUM SPONGE GRANULES or TITANIUM SPONGE POWDERS                                                        |
2-3-8 Self-reactive Substances and Mixtures

(1) Definitions

Definitions of self-reactive substances and mixtures in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.8.1)
2.8.1.1  Self-reactive substances or mixtures are thermally unstable liquid or solid substances or mixtures liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). This definition excludes substances and mixtures classified under the GHS as explosives, organic peroxides or as oxidizing.

2.8.1.2  A self-reactive substance or mixture is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.8.2)
2.8.2.1  Any self-reactive substance or mixture should be considered for classification in this class unless:

(a) They are explosives, according to the GHS criteria of Chapter 2.1;
(b) They are oxidizing liquids or solids, according to the criteria of Chapters 2.13 or 2.14, except that mixtures of oxidizing substances which contain 5% or more of combustible organic substances shall be classified as self-reactive substances according to the procedure defined in the note below;
(c) They are organic peroxides, according to the GHS criteria of Chapter 2.15;
(d) Their heat of decomposition is less than 300 J/g; or
(e) Their self-accelerating decomposition temperature (SADT) is greater than 75°C for a 50 kg package.

NOTE: Mixtures of oxidizing substances, meeting the criteria for classification as oxidizing substances, which contain 5.0% or more of combustible organic substances and which do not meet the criteria mentioned in (a), (c), (d) or (e) above, shall be subjected to the self-reactive substances classification procedure;

Such a mixture showing the properties of a self-reactive substance type B to F (see 2.8.2.2) shall be classified as a self-reactive substance.
2.8.2.2 Self-reactive substances and mixtures are classified in one of the seven categories of “Types A to G” for this class, according to the following principles:

(a) Any self-reactive substance or mixture which can detonate or deflagrate rapidly, as packaged, will be defined as **self-reactive substance TYPE A**;

(b) Any self-reactive substance or mixture possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as **self-reactive substance TYPE B**;

(c) Any self-reactive substance or mixture possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as **self-reactive substance TYPE C**;

(d) Any self-reactive substance or mixture which in laboratory testing:
   (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or
   (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or
   (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement;

will be defined as **self-reactive substance TYPE D**;

(e) Any self-reactive substance or mixture which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as **self-reactive substance TYPE E**;

(f) Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as **self-reactive substance TYPE F**;

(g) Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C to 75°C for a 50 kg package), and, for liquid mixtures, a diluent having a boiling point greater than or equal to 150°C is used for desensitization will be defined as **self-reactive substance TYPE G**. If the mixture is not thermally stable or a diluent having a boiling point less than 150°C is used for desensitization, the mixture shall be defined as self-reactive substance TYPE F.

**NOTE 1:** Type G has no hazard communication elements assigned but should be considered for properties belonging to other hazard classes.

**NOTE 2:** Types A to G may not be necessary for all systems.
2.8.2.3 Criteria for temperature control
Self-reactive substances need to be subjected to temperature control if their self-accelerating decomposition temperature (SADT) is less than or equal to 55°C. Test methods for determining the SADT as well as the derivation of control and emergency temperatures are given in the UN Recommendations for the Transport of Dangerous Goods, Manual of Tests and Criteria, Part II, section 28. The test selected shall be conducted in a manner which is representative, both in size and material, of the package.

(3) Guidance for Classification
A) Judgment of Not applicable
1) Gases, explosives, and liquids and solids classified as organic peroxides and oxidizing substances shall be “Not applicable”.
2) Substances not containing chemical groups related to explosibility (2-2-7) or self-reactivity (2-2-8) shall be “Not applicable”.

B) Judgment of Not Classified
Regarding the substances containing chemical groups related to explosibility or self-reactivity, if data on SADT or exothermic decomposition are obtained from prescribed review documents and the guidance of 2.8.2.1(d) (e) in the UN GHS 4th revised edition is applicable to the substances, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds and Problems” with “SADT ** °C” (** is filled with a specific value).

C) Classification based on UNRTDG Classification and so on
If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it.

Pure substances of some transport-prohibited substances listed in “Notice to settle Transportation Standards and the like of Dangerous Goods by Ship”, Article 5 (1) to (4), based on the Dangerous Goods Regulations, Article 7 (1), belong to the self-reactive substance TYPE A. However, they shall be classified into those containing a required stabilization agent, not into TYPE A.

Substances that cannot be classified by the procedure mentioned above shall be classified as “Classification not possible”.

In UNRTDG classification, self-reactive substances or mixtures take precedence over other hazards along with explosives, pyrophoric substances, and organic peroxide. Therefore, if a substance has been classified as another lower hazard class (except N.O.S.), the “Classification result” can be “Type G” with identification for the “Classification Grounds and Problems” that “It is classified in ○○, so is considered to be not applicable to hazards of the highest precedence, “self-reactive substances”.”
(4) Data availability

Few measurement data related to the flow chart of UN GHS 4th revised edition 2.8.4 have been published.

Mostly, self-reactive substances are traded and used as prepared chemicals in which diluents and/or stabilizing agents are added to them, rather than as pure substances. Classification into TYPE A to G should be made based on a test for individual prepared chemicals.

(5) Comparison with conventional classification systems

The flow chart of UN GHS 4th revised edition GHS2.8.4 is exactly the same as that of UNRTDG (Figure 2.4.1). In EmS, self-reactive substances not requiring temperature control are classified into Schedule S-G along with Flammable Solid, and those requiring are classified into Schedule S-K. In ERG, they are classified in Schedule 149 and 150.

(6) Sources of information for classification results under conventional systems

Chemicals which belong to UNRTDG 4.1 ERG149, 150 in UNRTDG and North-America Emergency Response Guidebook fall under this class.

There is no article with a specific name that fall under this division.

Those substances categorised as Type G are not applied to UNRTDG.
2-3-9 Pyrophoric Liquids

(1) Definitions

Definitions of pyrophoric liquids in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(2.9.1)

A pyrophoric liquid is a liquid which, even in small quantities, is liable to ignite within five minutes after coming into contact with air.

(2) Classification criteria in GHS

【GHS 4th revised edition】(2.9.2)

A pyrophoric liquid is classified in a single category for this class using test N.3 in Part III, sub-section 33.3.1.5 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, according to the following table:

Table 2.9.1: Criteria for pyrophoric liquids

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The liquid ignites within 5 min when added to an inert carrier and exposed to air, or it ignites or chars a filter paper on contact with air within 5 min.</td>
</tr>
</tbody>
</table>

(3) Guidance for Classification

A) Judgment of Not applicable

Substances and mixtures that are gases and solids shall be judged as “Not applicable”.

B) Judgment of Not Classified

If it is confirmed based on the information of prescribed review documents that a substance to be assessed does not self-ignite on contact with air of ambient temperature, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds” with “Do not self-ignite in contact with air of ambient temperature”.

Reliable ignition point data can be used as dependable judgment criteria.

(Note) If it is confirmed based on the information of prescribed review documents that the ignition point of a substance exceed about 70°C, the substance can be classified as “Not classified”. Example: This is not considered to ignite at ambient temperature, because its ignition point is @@°C (source, year of publication).

Reference: UN GHS 4th revised edition 2.9.4.2 and 2.10.4.2

A substance is not presumed to be “not pyrophoric” for the reason that its flash point is high. UNRTDG requires continuous combustion of the substance for determination of
spontaneous combustibility, whereas GHS does not. (Refer to UN GHS 4th revised edition, 2.6.2, Note 2.)

C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle. However, if it is confirmed that a substance to be assessed does not self-ignite on contact with air of ambient temperature, the substance can be classified as “Not classified”.

In UNRTDG classification, pyrophoric substances take precedence over other hazards along with explosives, self-reactive substances, and organic peroxide. Therefore, if a substance has been classified as another lower hazard class (except N.O.S.), the “Classification result” can be “Not classified” with the indication for the “Classification Grounds and Problems” that “It is classified in ○○, so is considered to be not applicable to hazards of the highest precedence, “pyrophoric liquids.””

(4) Data availability

 Few data have been published.

(5) Comparison with conventional classification systems

The definition of Pyrophoric Liquids in UN GHS 4th revised edition GHS2.9.1 is identical with that of UNRTDG 2.4.3.2.2. In addition, as stated in 2.4.3.3.1, the Packing Group for it is defined as “I”.

In EmS, Pyrophoric Liquids, along with Solid described in 2-3-10, are classified into Schedule S-M (Pyrophoric Hazards) or S-L (Pyrophoric substances and water-reactive substances).

In ERG, they are included in Schedule 135 and 136 (Pyrophoric substances), but are not distinguished from Self-heating Substances and Mixtures described in 2-3-11.

(6) Sources of information for classification results under conventional systems

It is judged that Category 1 is identical with UNRTDG 4.2 I (Liquids).

(Example) UNRTDG 4.2 I 1366 DIETHYLZINC
1370 DIMETHYLZINC
1380 PENTABORANE
2445 LITHIUM ALKYLs 4.2 4.3
2870 ALUMINIUM BOROHYDRIDE
ALUMINIUM BOROHYDRIDE IN DEVICES
3053 MAGNESIUM ALKYLs
3076 ALUMINIUM ALKYL HYDRIDES
3254 TRIBUTYLPHOSPHANE
3255 tert-BUTYL HYPOCHLORITE

(Note) These are quoted from UNRTDG, 14th edition. After UNRTDG’s 15th edition, each individual name of organometallic compounds is deleted and generic names such as 3392 ORGANOMETALLIC, SUBSTANCE, LIQUID, PYROPHORIC are used. It is possible to refer to the classification of individual compounds listed in a previous edition of UNRTDG for GHS classification.
2-3-10 Pyrophoric Solids

(1) Definitions

Definitions of pyrophoric solids in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.10.1)

A pyrophoric solid is a solid which, even in small quantities, is liable to ignite within five minutes after coming into contact with air.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.10.2)

A pyrophoric solid is classified in a single category for this class using test N.2 in Part III, sub-section 33.3.1.4 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria according to the following table:

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The solid ignites within 5 min of coming into contact with air.</td>
</tr>
</tbody>
</table>

**NOTE:** For classification tests on solid substances or mixtures, the tests should be performed on the substance or mixture as presented. If for example, for the purposes of supply or transport, the same chemical is to be presented in a physical form different from that which was tested and which is considered likely to materially alter its performance in a classification test, the substance or mixture must also be tested in the new form.

(3) Guidance for Classification

A) Judgment of Not applicable

Substances and mixtures that are gas and liquids shall be “Not applicable”.

B) Judgment of Not Classified

If it is confirmed based on the information of prescribed review documents or is judged based on experiences that a substance to be assessed does not self-ignite on contact with air of ambient temperature, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds” with “Do not self-ignite on contact with air of ambient temperature”.

Fill-in example: In the class of “Pyrophoric Solids”, “Not classified” (Do not self-ignite on contact with air of ambient temperature.) Reliable ignition point data can be used as dependable judgment criteria.

(Note) If it is confirmed based on the information of prescribed review documents that the ignition point of a substance exceed about 70°C, the substance can be classified as “Not
C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle. However, if it is confirmed that a substance to be assessed does not self-ignite on contact with air of ambient temperature, the substance can be classified as “Not classified”.

In UNRTDG classification, pyrophoric substances take precedence over other hazards along with explosives, self-reactive substances, and organic peroxide. Therefore, if a substance has been classified as another lower hazard class (except N.O.S.), the “Classification result” can be “Not classified” with the indication for the “Classification Grounds and Problems” that “It is classified in ○○, so considered to be not applicable to hazards of the highest precedence, “pyrophoric solids”.

(4) Data availability

Few data have been published.

(5) Comparison with conventional classification systems

The definition of Pyrophoric Solids in GHS 2.10.1 is identical with that of UNRTDG 2.4.3.2.1. In addition, as stated in 2.4.3.3.1, the Packing Group for it is defined as “I”.

In EmS, Pyrophoric Solids, along with Liquids described in 2-3-9, are classified into Schedule S-M (Pyrophoric Hazards) or S-L (Pyrophoric substances and water-reactive substances).

In ERG, they are included in Schedule 135 and 136 (Pyrophoric substances), but are not distinguished from Self-heating Substances and Mixtures described in 2-3-11.

(6) Sources of information for classification results under conventional systems

It is judged that Category 1 is identical with UNRTDG 4.2 1 (Solid).

(Example) UNRTDG 4.2 1

2546     TITANIUM POWDER, DRY

(Note) “2005 MAGNESIUM DIPHENYL” is quoted from UNRTDG, 14th edition. After UNRTDG’s 15th edition, each individual name of organometallic compounds is deleted and generic names such as 3391 ORGANOMETALLIC SUBSTANCE, SOLID, PYROPHORIC come to be used. It is possible to refer to UN classification of individual compounds listed in a previous edition for GHS classification.
2-3-11 Self-heating Substances and Mixtures

(1) Definitions
Definitions of self-heating substances and mixtures in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.11.1)

A self-heating substance or mixture is a solid or liquid substance or mixture, other than a pyrophoric liquid or solid, which, by reaction with air and without energy supply, is liable to self-heat; this substance or mixture differs from a pyrophoric liquid or solid in that it will ignite only when in large amounts (kilograms) and after long periods of time (hours or days).

**NOTE:** Self-heating of substances or mixtures is a process where the gradual reaction of the substance or mixture with oxygen (in air) generates heat. If the rate of heat production exceeds the rate of heat loss, then the temperature of the substance or mixture will rise which, after an induction time, may lead to self-ignition and combustion.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.11.2)

2.11.2.1 A substance or mixture shall be classified as a self-heating substance of this class, if in tests performed in accordance with the test method given in the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, Part III, sub-section 33.3.1.6:

(a) A positive result is obtained using a 25 mm cube sample at 140°C;
(b) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a negative result is obtained in a test using a 100 mm cube sample at 120°C and the substance or mixture is to be packed in packages with a volume of more than 3 m³;
(c) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a negative result is obtained in a test using a 100 mm cube sample at 100°C and the substance or mixture is to be packed in packages with a volume of more than 450 litres;
(d) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a positive result is obtained using a 100 mm cube sample at 100°C.

2.11.2.2 A self-heating substance or mixture is classified in one of the two categories for this class if, in test performed in accordance with test method N.4 in Part III, sub-section 33.3.1.6 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, the result meets the criteria shown in Table 2.11.1.
Table 2.11.1: Criteria for self-heating substances and mixtures

</tbody>
</table>
| 2        | (a) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a negative result is obtained in a test using a 25 mm cube sample at 140°C and the substance or mixture is to be packed in packages with a volume of more than 3 m³; or  
(b) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a negative result is obtained in a test using a 25 mm cube sample at 140°C, a positive result is obtained in a test using a 100 mm cube sample at 120°C and the substance or mixture is to be packed in packages with a volume of more than 450 litres; or  
(c) A positive result is obtained in a test using a 100 mm sample cube at 140°C and a negative result is obtained in a test using a 25 mm cube sample at 140°C, and a positive result is obtained in a test using a 100 mm cube sample at 100°C. |

**NOTE 1:** For classification tests on solid substances or mixtures, the tests should be performed on the substance or mixture as presented. If for example, for the purposes of supply or transport, the same chemical is to be presented in a physical form different from that which was tested and which is considered likely to materially alter its performance in a classification test, the substance or mixture must also be tested in the new form.

**NOTE 2:** The criteria are based on the self-ignition temperature of charcoal, which is 50 °C for a sample cube of 27 m³. Substances and mixtures with a temperature of spontaneous combustion higher than 50 °C for a volume of 27 m³ should not be assigned to this hazard class. Substances and mixtures with a spontaneous ignition temperature higher than 50 °C for a volume of 450 litres should not be assigned to hazard Category 1 of this hazard class.

(3) Guidance for Classification

A) Judgment of Not applicable

1) Substances and mixtures that are gases shall be judged as “Not applicable”.
2) Pyrophoric liquids and solids shall be judged as “Not applicable”.

B) Judgment of Not Classified

Non-flammable liquids and solids shall be judged as “Not classified”.

C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle.

D) Classification based on data from prescribed literatures
If the data of screening test described in the UN GHS 4th revised edition 2.11.4.2 are obtained for a substance from prescribed review documents, and the data show that it is not a self-heating substance, it shall be classified as “Not classified”, and “Classification Grounds and Problems” shall be filled in with the result of the test.

As to the substances for which the classification result on Pyrophoric Liquids is “Category 1”, or liquid substances to be assessed other than those for which the classification result on “Self-heating Substances and Mixtures” is “Not classified” based on “inflammable” information, fill in “Classification result” of “Self-heating Substances and Mixtures” with “Classification not possible”, and fill in “Classification Grounds” with “No established test method suitable for liquid substances”.

For reference: The test for “Self-heating Substances and Mixtures” defined in UNRTDG classification and also adopted in GHS classification, in which a specimen is kept in a stainless-steel mesh cage in a thermostatic chamber for 24 hours, cannot be applied to liquids (and solid with a melting point of 140 °C or lower). Therefore, in the government’s classification procedure for liquid substances, “No established test method suitable for liquid substances” instead of “No data available.” shall be indicated for “Classification Grounds and Problems” “No data available” shall be indicated for solids with a melting point over 140 °C. On the other hand, solids with a melting point of 140 °C or lower, “No established test method suitable for solid substances with a melting point of 140 °C or lower” shall be indicated.

(4) Data availability

Few data for each substance has been published.

(5) Comparison with conventional classification systems

In Division 4.2 described in UNRTDG 2.4.3.2.3, the definition of Self-heating Substances accords with the classification criteria of GHS 2.11.2. Packing Group II corresponds to GHS Category 1, and Packing Group III corresponds to Category 2. Division 4.2 also includes Pyrophoric Solids (2.4.3.2.1) and Pyrophoric Liquids (2.4.3.2.2).

In ERG, self-heating substances and mixtures are included in Schedule 135 and 136 (Self-heating Substances).

In EmS, they are included in Schedule S-J (wetted explosives and self-heating substances). The former one belongs to UNRTDG Division 4.1, as described in 2.3.1.

(6) Sources of information for classification results under conventional systems

Substances classified into UNRTDG 4.2 EmS: S-J fall under this class.

(Example of category 1) UNRTDG 4.2 Π EmS: S-J
p-NITROSODIMETHYLANILINE
POTASSIUM SULPHIDE, ANHYDROUS or POTASSIUM SULPHIDE with less than 30% water of crystallization
SODIUM DITHIONITE (SODIUM HYDROSULPHITE)
SODIUM SULPHIDE, ANHYDROUS or SODIUM SULPHIDE with less than 30% water of crystallization
CALCIUM DITHIONITE (CALCIUM HYDROSULPHITE)
POTASSIUM DITHIONITE (POTASSIUM HYDROSULPHITE)
SODIUM HYDROSULPHIDE with less than 25% water of crystallization
9-PHOSPHABICYCLONANONES (CYCLOOCTADIENE PHOSPHINES)
THIOUREA DIOXIDE
(Example of category 2) UNRTDG 4.2 III EmS: S-J
CARBON, ACTIVATED
COPRA
COTTON WASTE, OILY
COTTON, WET
PAPER, UNSATURATED OIL TREATED, incompletely dried (including carbon paper)
WOOL WASTE, WET
SEED CAKE with more than 1.5% oil and not more than 11% moisture
TEXTILE WASTE, WET
CELLULOID, SCRAP
FERROUS METAL BORINGS, SHAVINGS, TURNINGS or CUTTINGS in a form liable to self-heating
TITANIUM DISULPHIDE
2-3-12 Substances and mixtures which, in contact with water, emit flammable gases

(1) Definitions

Definitions of substances and mixtures which in contact with water, emit flammable gases in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.12.1)

*Substances or mixtures which, in contact with water, emit flammable gases* are solid or liquid substances or mixtures which, by interaction with water, are liable to become spontaneously flammable or to give off flammable gases in dangerous quantities.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.12.2)

A substance or mixture which, in contact with water, emit flammable gases is classified in one of the three categories for this class, using test N.5 in Part III, sub-section 33.4.1.4 of the *UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria*, according to the following table:

Table 2.12.1: Criteria for substances and mixtures which, in contact with water, emit flammable gases

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Any substance or mixture which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 litres per kilogram of substance over any one minute.</td>
</tr>
<tr>
<td>2</td>
<td>Any substance or mixture which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 litres per kilogram of substance per hour, and which does not meet the criteria for Category 1.</td>
</tr>
<tr>
<td>3</td>
<td>Any substance or mixture which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 1 litre per kilogram of substance per hour, and which does not meet the criteria for Categories 1 and 2.</td>
</tr>
</tbody>
</table>

**NOTE 1:** A substance or mixture is classified as a substance which, in contact with water, emits flammable gases if spontaneous ignition takes place in any step of the preliminary test procedure.

**NOTE 2:** For classification tests on solid substances or mixtures, the tests should be performed
(3) Guidance for Classification

A) Judgment of Not applicable
1) Substances for gases shall be judged as “Not applicable”.
2) Substances not containing metals and metalloids in their chemical structure shall be judged as “Not applicable”.

B) Judgment of Not Classified

If it is judged based on the information of prescribed review documents that a substance containing metals or metalloids is stable even if it is in contact with water (for example, if its water solubility (instead of “no reaction to water”) is known, it shall be “Not classified” because it does not emit flammable gases. Example: It contains metalloid (Si), but is considered not to react with water violently from the data on water solubility ○○mg/L (source, year of publication).

Reference: UN GHS 4th revised edition 2.12.4.2(b)(c)

C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle.

(4) Data availability

Few numerical data on the rate of evolution of gas have been published.

(5) Comparison with conventional classification systems

Judgment criteria of GHS2.12.2 completely accord with the definition of UNRTDG Division 4.3.

Judgment criteria of EU classification accord with those of GHS, but further categorization is not given for the former.

(6) Sources of information for classification results under conventional systems

Based on the laws and regulations pursuant to the applicable UNRTDG (In Japan, “Dangerous Goods Regulations” correspond to them).

Category 1 = UNRTDG 4.3 I
Category 2 = UNRTDG 4.3 II
Category 3 = UNRTDG 4.3 III
Substances classified into UNRTDG 4.2 (4.3) correspond to GHS Category 1.

Substances classified into EU DSD Classification R15 meet GHS judgment criteria, but they do not correspond to Category 1, 2, and 3.

In ERG, Schedules related to “Substances which, in contact with water, emit flammable gases” of GHS are as follows:

- 135: Pyrophoric substances
- 138: Water-reactive substances – emitting flammable gas
- 139: Water-reactive substances – emitting flammable/toxic gas

Example of substances meeting the judgment criteria:

**Category 1**

- **UNRTDG 4.3I** ERG138: Alkali metals and their alloys, hydrides, amalgams and suspended solids including alkali earth metals
  - 1410 LITHIUM ALUMINIUM HYDRIDE
  - 1426 SODIUM BOROHYDRIDE
  - 1428 SODIUM

- **UNRTDG 4.3 I** ERG139: Phosphides and part of silane compounds)
  - 1183 ETHYLDICHLOROSILANE
  - 1360 CALCIUM PHOSPHIDE
  - 1714 ZINC PHOSPHIDE

**Category 2**

- **UNRTDG 4.3II** ERG138: ALKALI EARTH METALS, METAL CARBIDES and SILICIDES
  - 1394 ALUMINIUM CARBIDE
  - 1401 CALCIUM
  - 2624 MAGNESIUM SILICIDE

- **UNRTDG 4.3 II** ERG139: PHOSPHIDES and some SILANE COMPOUNDS
  - 1340 PHOSPHORUS PENTASULPHIDE
  - 1395 ALUMINIUM FERROSILICON POWDER

**Category 3**

- **UNRTDG 4.3 III** ERG138: LIGHT METALS and METAL SILICIDES
  - 1398 ALUMINIUM SILICON POWDER, UNCOATED
  - 1435 ZINC ASHES

- **UNRTDG 4.3 III** ERG139: METAL SILICIDES
  - 1408 FERROSILICON with 30% or more but less than 90% silicon

Water-reactive substances failing to meet GHS judgment criteria:

There are substances which, in contact with water, emit an inflammable gas (often toxic or corrosive) or produce heat (and dangerous droplets at the same time). These are not included in
GHS classification, but they have a Schedule name including the word “water-reactive” in ERG.

137: Water-reactive substances - corrosive
   Example: PHOSPHORUS PENTOXIDE, SULFURIC ACID
144: Oxidant (Water-reactive) SODIUM PEROXIDE
155: Toxic substances/corrosive substances (flammable/water-reactive) ACETONE CYANOHYDRIN
156: Toxic substances/corrosive substances (flammable/water-reactive) BENZYL CHLORIDE
157: Toxic substances/corrosive substances (flammable/water-reactive) ANTIMONY TRICHLORIDE
166: Radioactive substances – corrosive (URANIUM HEXAFLUORIDE – water-reactive)

These should be considered separately from “Water-reactive flammable” in GHS.

(7) Discussion on GHS Water-Reactive Flammable Substances and Metalloids
A) Description of UN GHS 4th revised edition 2.12
   Section 2.12.4.2 of UN GHS 4th revised edition 2.12 “Substances or mixtures which, in contact with water, emit flammable gases” includes a description: “The classification procedure for this class need not be applied if the chemical structure of the substance or mixture does not contain metals or metalloids”. For smooth classification according to GHS, the definition of “metalloids” is summarized as follows:
B) Metalloid
   A metalloid is defined as a substance having an intermediate property between those of metals and nonmetals. The property is related to the electric conduction property of single element solids. In the website of Institute for Molecular Science (Okazaki Institute), National Institute of Nature Sciences, Inter-University Research Institute Corporation, B, C, Si, P, Ge, As, Se, Sn, Sb, Te, Bi, Po, At are listed as metalloids. For example, it is presumed that carbon is classified as metalloid because it has a peculiar conductivity in the form of graphite structure.
C) Water-reactive flammable substances
   Water-reactive flammable substances are the substances which, on contact with water, deprive it of oxygen and emit flammable gases (hydrogen, hydrocarbon, hydrogen sulfide, etc). Therefore, the category “Water-reactive flammable substances” has no direct causal relation with metalloids, which are defined based on the electric conduction property. Giving a theoretical explanation for the description of UN GHS 4th revised edition 2.12.4.2(a), requires the application of quite an advanced electron theory.
Most of the substances listed in Division 4.3 in UNRTDG classification, however, are actually metals or metal compounds (hydrides, phosphides, carbides, silicon compounds, borohydrides, alkyl compounds, etc.), and a few metalloid compounds shown below (excluding N.O.S.) are also included in the list.

- **UN 1183** ETHYLDICHLOROSILANE
- **UN 1242** METHYLDICHLOROSILANE
- **UN 1295** TRICHLOROSILANE
- **UN 1340** PHOSPHORUS PENTASULFIDE
- **UN 2965** BORON TRIHYDRIDE • DIMETHYL ETHER SOLUTION

As substances included in Division 4.3, the following two carbon compounds (excluding metal alkylates) are listed:

- **UN 1394** ALUMINUM CARBIDE
- **UN 1402** CALCIUM DICARBIDE

Since these substances contain a metal, they are not excluded from “water-reactive flammable substances” even if carbon is excluded from metalloids.

It is presumed that the description of UN GHS 4th revised edition 2.12.4.2(a), “The chemical structure of the substance or mixture does not contain metals and metalloids” intends to eliminate the discussion on classification assessment for huge amounts of organic compounds composed of only carbon, hydrogen, nitrogen, oxygen, sulfur, and four halogen elements. The aim will be lost if carbon is included in metalloids.

**D) Scope of the metalloid**

If phosphorus is interpreted to be excluded from “metaloids” defined in UN GHS 4th revised edition 2.12.4.2(a), phosphorus pentasulfide is excluded. Although compounds composed of selenium, tellurium and nonmetal elements are not considered to be water-reactive, they are included in the substances containing metalloids.

Alternatively, it is easier to understand if the description in 2.12.4.2(a) is rephrased as follows: “The classification procedure for this class need not be applied to a substance composed of carbon, hydrogen, nitrogen, oxygen, sulfur, and one or more of four halogen elements, as well as a mixture (solid or liquid) composed of these elements only”. Nevertheless, the description of UN GHS 4th revised edition adopting the term “metaloids” shall be followed.

If a substance or mixture falls under the exemption described in 2.12.4.2(a), fill the model classification with “Not applicable”, and fill “Grounds” with “Not containing metal or metalloids (B, Si, P, Ge, As, Se, Sn, Sb, Te, Bi, Po, At)”.  

**E) Assessment of inorganic metal compounds**

Substances and mixtures exempted from the assessment, based on UN GHS 4th revised edition 2.12.4.2(a), are the most part of organic compounds (except for organic metal
compounds) and a part of inorganic compounds. Thus, the large majority of inorganic metal compounds remain unmentioned. With regard to them, those known to be stable in water according to UN GHS 4th revised edition 2.12.4.2(b) (c) shall be classified as “Not classified”.

For the grounds for judgment, see “water solubility” and “reactivity” fields, which are common in the classification entry forms. If the value of aqueous solubility is indicated there or if descriptions such as “water soluble” or “insoluble” are present, it shall be classified as “Not classified”. If a substance is water-reactive, a statement such as “react vigorously with water” is to be entered in the “reactivity” field.
2-3-13 Oxidizing Liquids

(1) Definitions

Definitions of oxidizing liquids in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.13.1)

An oxidizing liquid is a liquid which, while in itself not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.13.2)

An oxidizing liquid is classified in one of the three categories for this class using test O.2 in Part I II, sub-section 34.4.2 of the UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, according to the following table:

Table 2.13.1: Criteria for oxidizing liquids

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Any substance or mixture which, in the 1:1 mixture, by mass, of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture, by mass, of substance and cellulose is less than that of a 1:1 mixture, by mass, of 50% perchloric acid and cellulose;</td>
</tr>
<tr>
<td>2</td>
<td>Any substance or mixture which, in the 1:1 mixture, by mass, of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture, by mass, of 40% aqueous sodium chlorate solution and cellulose; and the criteria for Category 1 are not met;</td>
</tr>
<tr>
<td>3</td>
<td>Any substance or mixture which, in the 1:1 mixture, by mass, of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture, by mass, of 65% aqueous nitric acid and cellulose; and the criteria for Categories 1 and 2 are not met.</td>
</tr>
</tbody>
</table>

(3) Guidance for Classification

A) Judgment of Not applicable

1) Gases and solid chemicals shall be judged as “Not applicable”.

2) Organic substances which do not contain oxygen, fluorine, or chlorine or which contain any of these elements that are bound to carbon or hydrogen only shall be judged “Not
3) Inorganic substances not containing oxygen or a halogen element shall be judged “Not applicable”.

B) Judgment of Not Classified

If it is confirmed based on the review documents that a substance to be assessed is “reductive material”, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds” with “Reductive material”.

If an organic compound contains chlorine as chloride ions, it shall be classified as “Not classified” because a chloride ion does not contribute to oxidization.

C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle.

(4) Data availability

Few experimental data on oxidative materials have been published.

(5) Comparison with conventional classification systems

The definition in GHS2.13.2 is equivalent to that of UNRTDG Division 5.1 “Liquids” (UNRTDG 2.5.2.3.2). In ERG, oxidative materials (including Solid) are classified into Schedules 140, 141, 142, 143 and 144, but it does not serve as a reference for this GHS classification. In EmS, oxidative materials (including Solid) are classified into Schedule S-Q.

(6) Sources of information for classification results under conventional systems

Category 1 = UNRTDG 5.1 I (Liquids)
Category 2 = UNRTDG 5.1 II (Liquids)
Category 3 = UNRTDG 5.1 III (Liquids)

(Example of category 1)

1873 PERCHLORIC ACID with more than 50% but not more than 72% acid, by mass

2495 IODINE PENTAFLUORIDE

(Example of category 2)

2014 HYDROGEN PEROXIDE, AQUEOUS SOLUTION with more than 20% but not more than 40% hydrogen peroxide

2427 POTASSIUM CHLORATE, AQUEOUS SOLUTION with more than 8% but not more than 20% potassium chlorate

(Example of category 3)
HYDROGEN PEROXIDE, AQUEOUS SOLUTION with not less than 8% but less than 20% hydrogen peroxide (stabilized as necessary)
2-3-14 Oxidizing Solids

(1) Definitions

Definitions of oxidizing solids in UN GHS are as follows, and they are adopted in this guidance.

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture, by mass, of potassium bromate and cellulose.</td>
</tr>
<tr>
<td>2</td>
<td>Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for Category 1 are not met.</td>
</tr>
<tr>
<td>3</td>
<td>Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for Categories 1 and 2 are not met.</td>
</tr>
</tbody>
</table>

NOTE 1: Some oxidizing solids may also present explosion hazards under certain conditions (e.g. when stored in large quantities). For example, some types of ammonium nitrate may give rise to an explosion hazard under extreme conditions and the “Resistance to detonation test” (BC Code¹, Annex 3, Test 5) may be used to assess this hazard. Appropriate comments should be made in the Safety Data Sheet.

NOTE 2: For classification tests on solid substances or mixtures, the tests should be performed on the substance or mixture as presented. If for example, for the purposes of supply or transport, the same chemical is to be presented in a physical form different from that which was tested and which is considered likely to materially alter its performance in a classification test, the substance
(3) Guidance for Classification
   A) Judgment of Not applicable
      1) Gases and liquid chemicals shall be judged as “Not applicable”.
      2) Organic substances which do not contain oxygen, fluorine, or chlorine or which contain any of these elements that are bound to carbon or hydrogen only shall be judged “Not applicable”.
      3) Inorganic substances not containing oxygen or any halogen element shall be judged “Not applicable”.
   B) Judgment of Not Classified
      If it is confirmed based on the review documents that a substance to be assessed is “reductive material”, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds and Problems” with “Reductive material”.
      If an organic compound contains chlorine as chloride ions, it shall be classified as “Not classified” because a chloride ion does not contribute to oxidization.
   C) Classification based on UNRTDG Classification
      If the name of a substance is included in UNRTDG classification, the substance shall be classified according to it. If not, it falls under “Classification not possible” in principle.

(4) Data availability
   Few experimental data on oxidative materials have been published.

(5) Comparison with conventional classification systems
   The classification criteria of GHS2.14.2 are equivalent to the definition of UNRTDG Division 5.1 “Solid” (UNRTDG 2.5.2.2.2).
   In ERG, oxidative materials (including Liquids) are classified into Schedules 140, 141, 142, 143 and 144, but it does not serve as a reference for this GHS classification. In EmS, oxidative materials (including Liquids) are classified into Schedule S-Q.

(6) Sources of information for classification results under conventional systems
   Category 1 = UNRTDG 5.1 I (Solid)
   Category 2 = UNRTDG 5.1 II (Solid)
   Category 3 = UNRTDG 5.1 III (Solid)

(Example of category 1) 1504 SODIUM PEROXIDE
2466  POTASSIUM SUPEROXIDE
(Example of category 2)1439  AMMONIUM DICHROMATE
1463  CHROMIUM TRIOXIDE, ANHYDROUS
1493  SILVER NITRATE
1496  SODIUM CHLORITE
2719  BARIUM BROMATE
(Example of category 3)2067  AMMONIUM NITRATE BASED FERTILIZER
2469  ZINC BROMATE
2724  MANGANESE NITRATE
2728  ZIRCONIUM NITRATE
2-3-15 Organic Peroxides

(1) Definitions

Definitions of organic peroxides in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(2.15.1)

2.15.1.1 Organic peroxides are liquid or solid organic substances which contain the bivalent \(-O-O-\) structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties:

(a) be liable to explosive decomposition;
(b) burn rapidly;
(c) be sensitive to impact or friction;
(d) react dangerously with other substances.

2.15.1.2 An organic peroxide is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.

(2) Classification criteria in GHS

【GHS 4th revised edition】(2.15.2)

2.15.2.1 Any organic peroxide shall be considered for classification in this class, unless it contains:

(a) not more than 1.0% available oxygen from the organic peroxides when containing not more than 1.0% hydrogen peroxide; or
(b) not more than 0.5% available oxygen from the organic peroxides when containing more than 1.0% but not more than 7.0% hydrogen peroxide.

NOTE: The available oxygen content (%) of an organic peroxide mixture is given by the formula:

\[
16 \times \sum_{i} \left( \frac{n_{i} \times c_{i}}{m_{i}} \right)
\]

where: \(n_{i}\) = number of peroxygen groups per molecule of organic peroxide \(i\);
\(c_{i}\) = concentration (mass %) of organic peroxide \(i\);
\(m_{i}\) = molecular mass of organic peroxide \(i\).

2.15.2.2 Organic peroxides are classified in one of the seven categories of “Types A to G” for
this class, according to the following principles:

(a) Any organic peroxide which, as packaged, can detonate or deflagrate rapidly will be defined as **organic peroxide TYPE A**;

(b) Any organic peroxide possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as **organic peroxide TYPE B**;

(c) Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as **organic peroxide TYPE C**;

(d) Any organic peroxide which in laboratory testing:
   (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or
   (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or
   (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement;

will be defined as **organic peroxide TYPE D**;

(e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as **organic peroxide TYPE E**;

(f) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as **organic peroxide TYPE F**;

(g) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and, for liquid desensitization, will be defined as **organic peroxide TYPE G**. If the organic peroxide desensitization, it shall be defined as organic peroxide TYPE F.

**NOTE 1:** Type G has no hazard communication elements assigned but should be considered for properties belonging to other hazard classes.

**NOTE 2:** Types A to G may not be necessary for all systems.

2.15.2.3 **Criteria for temperature control**

The following organic peroxides need to be subjected to temperature control:

(a) Organic peroxide types B and C with an SADT ≤ 50°C;
(b) Organic peroxide type D showing a medium effect when heated under confinement with an SADT ≤ 50°C or showing a low or no effect when heated under confinement with an SADT ≤ 45°C; and

c(c) Organic peroxide types E and F with an SADT ≤ 45°C.

Test methods for determining the SADT as well as the derivation of control and emergency temperatures are given in the *UN Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria*, Part II, section 28. The test selected shall be conducted in a manner which is representative, both in size and material, of the package.

1 As determined by test series E as prescribed in the Manual of Tests and Criteria, Part II.

(3) Guidance for Classification

A) Judgment of Not applicable

Inorganic substances and organic substances except Organic Peroxides are judged “Not applicable”.

B) Judgment of Not Classified

If the hydrogen peroxide content and the amount of available oxygen in a Organic Peroxide fall below the values stipulated in UN GHS 4th revised edition 2.15.2.1, fill in “Classification result” with “Not classified”, and fill in “Classification Ground” with “Active oxygen amount fails to satisfy the definition”.

C) Classification based on UNRTDG Classification

If the name of a substance is included in UNRTDG classification (for example, it is listed in the table of IMDGC2.5.3.2.4), the substance shall be classified according to the UN number. If not, it falls under “Classification not possible” in principle.

In UNRTDG classification, organic peroxide takes precedence over other hazards along with explosives, self-reactive substances, and pyrophoric substances. Therefore, if a substance has been classified as another lower hazard class (except N.O.S.), the “Classification result” can be “Type G” with the indication for “Classification Grounds and Problems” that “It is classified in ○○, so considered to be not applicable to hazards of the highest precedence,”organic peroxides”.

(4) Data availability

The available oxygen content can be easily calculated by anyone who has basic knowledge of chemistry. However, in the case of hydrogen peroxide content, chemical analysis is presumably required to determine it, unless hydrogen peroxide is added intentionally, in which case the added amount is known. Few data of measurement experiments related to the decision logic 2.15 of GHS2.15.4 have been published.
Organic Peroxides are often traded and used as prepared chemicals in which diluents and/or stabilizing agents are added to them, rather than as chemical substances. Classification into TYPE A to G should be made based on a test for individual prepared chemicals.

(5) Comparison with conventional classification systems

The decision logic 2.15 of GHS 2.15.4 is exactly the same as that of UNRTDG (Figure 2.5.1).

(6) Sources of information for classification results under conventional systems

Chemicals which belong to UNRTDG 5.2 ERG147, 148 in UNRTDG and North-America Emergency Response Guidebook fall under this class.

DI-(2-ETHYLHEXYL) PEROXYDICARBONATE (≤52%, stable frozen-water dispersion element)
2-3-16 Corrosive to Metals

(1) Definitions

Definitions of corrosive to metals in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (2.16.1)
A substance or a mixture which is corrosive to metals is a substance or a mixture which by chemical action will materially damage, or even destroy, metals.

(2) Classification criteria in GHS

【GHS 4th revised edition】 (2.16.2)
A substance or a mixture which is corrosive to metals is classified in a single category for this class, using the test in Part III, sub-section 37.4 of the UN Recommendations on the Transport of Dangerous Goods, Manual of tests and Criteria, according to the following table:

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Corrosion rate on either steel or aluminum surfaces exceeding 6.25 mm per year at a test temperature of 55°C when tested on both materials.</td>
</tr>
</tbody>
</table>

NOTE: Where an initial test on either steel or aluminum indicates the substance or mixture being tested is corrosive the follow-up test on the other metal is not required.

(3) Guidance for Classification

A) Judgment of Not Classified

Regarding “Corrosive to Metals”, if it is confirmed based on prescribed review documents that both steel and aluminum can be used as a container for the substance, fill in “Classification result” with “Not classified”, and fill in “Classification Grounds” with “Steel and aluminum can be used as a container”. If only either of them has information about its resistance to corrosion, the substance shall be classified as “Not classified” and information of usable metals shall be indicated in such description as “It should be noted …” for “Classification Grounds and Problems”.

B) Judgment for those substances that cannot be classified

1) In case the test method is not established

The test method for “Corrosive to Metals” defined in UNRTDG classification and adopted in GHS classification cannot be applied to gases. It cannot be applied to liquids with a boiling point of 55°C or lower, either. In case of solid, it can be applied to those with a melting point of 55°C or lower. The point is as follows:

- In the case of gases, “Classification result” shall be classified as “Classification not
possible” with regard to “Corrosive to Metals,” and “No established test method suitable for gas substances” shall be indicated for “Classification Grounds and Problems.”

- In the case of liquids with a boiling point of 55°C or lower, “Classification result” shall be classified as “Classification not possible” with regard to “Corrosive to Metals,” and “No established test method suitable for low-temperature-boiling liquids” shall be indicated for “Classification Grounds and Problems.”

- In the case of solids with a melting point of higher than 55°C, “Classification result” shall be classified as “Classification not possible” with regard to “Corrosive to Metals,” and “No established test method suitable for solid substances” shall be indicated for “Classification Grounds and Problems.”

- As for the above three cases, it is also permissible to simply indicate “No data” instead of indication of “Classification Grounds and Problems.”

2) In case of “Classification not possible” because of lack of data

For hazard items that cannot be classified by the above procedure, fill in “Classification result” with “Classification not possible”, and fill in “Classification Grounds” with “No data”.

(4) Data availability

Few numerical data on metal corrosion rate have been published.

(5) Comparison with conventional classification systems

Definitions of Corrosive to Metals, Category 1 in UN GHS, completely accords with that of the Class 8 III “Metal corrosivity” described in UNRTDG2.8.2.5(c) (ii).

(6) Sources of information for classification results under conventional systems

Since metal corrosivity is classified into UNRTDG Class 8 along with skin corrosivity, whether a substance has metal corrosivity or not cannot be judged from the fact that the substance is classified in Class 8. Metal corrosivity thus cannot be attributed to a substance based on “Dangerous Goods Regulations Annex 1” alone. Therefore, a substance of which corrosion speed to metals is clear shall be classified into this class if it meets the criteria. If it is not clear whether a substance has metal corrosivity, indicate “presumed” on the label for the substance.

GHS classification is based on UNRTDG, which was developed in relation to the leakage treatment of substances. It should be noted that even if a substance does not fall under this class, it still has a possibility to give damage to a container or pipe for storage or use.

Packing instructions such as P001 in UNRTDG show strength, etc., of the container and do not always guarantee that the metal used is chemically resistant to the relevant substance. Some containers have inner lining against corrosion. Packing instruction shall not be used as the
classification grounds of “Not classified.”

In the test of metal corrosivity, metal pieces (steel and aluminum) are immersed in a liquid (55°C) for 7 to 28 days, and if the corrosion length exceeds 6.25 mm (annualized value), the liquid is judged corrosive. This criterion for corrosivity was defined in light of the risk that the leakage of a liquid gives damage to a container of transport equipment or other freights when the leakage is not immediately treated. Thus, a different criterion should be applied when determining whether or not a metal can be used for the container or pipe of the liquid. If a liquid is corrosive, even if to a minimal extent, the use of a metal for its container impairs the liquid. In the definition of metal corrosivity in GHS, such a kind of criterion has not been adopted.

(Note)

In GHS, it is defined that if test data for a substance, acquired based on the prescribed test method, cannot be obtained from reliable sources, the substance shall be classified as “Classification not possible”. Therefore, some of gasses which are known to impair metals, such as ammonia gas and hydrogen chloride gas, are fall under “Classification not possible” because the test methods for them have not been defined.
Part 3 Health Hazards Guidance

3-1 Information and data available for classification

3-1-1 Sources of Information available for classification

In UN GHS, available data are reviewed for classification. In this guidance, procedures are shown below to reduce variations in classification results as much as possible, while facilitating classification.

Upon conducting investigations for classification, all of the acquired or accessible assessment documents shown in List 1 shall be reviewed regarding each of hazard shown in 3-2-1 to 3-2-10 and information on the relevant substances shall be looked for. If the selected source provides no or insufficient information needed, other information sources should be searched.

When the required information cannot be obtained from sources in List 1, the process with sources in List 2 shall be repeated.

Information sources in List 3 are integrated databases to search the original literatures or to have an idea of the toxicity, and they are to be utilized where appropriate.

Examples of major information sources containing a general introduction or useful databases are shown below. Information sources listed under each List are similar in reliability, but they may vary in toxicity indexes and substances listed (for example, WHO International Agency for Research on Cancer (IARC) specializes in information related to Carcinogenicity, and The Joint FAO/WHO Meeting on Pesticide Residues (JMPR), in agricultural chemicals). This should not limit the use of reliable and useful information sources other than those listed here.

Some on-line sites shown below revise posted information when appropriate, and acquiring the latest information from them is preferable.

(Note) On management of epidemiological data, refer to “3-1-3(2) Epidemiologic data”.

List 1:

Information sources provided by international organizations, governments of major countries, etc., whose reliability has been recognized. Basically, these are assessment documents and books whose primary documents can be traced and whose accuracy can be confirmed whenever needed.

However, when confirmation of reliability for individual pieces of information is needed, the source materials should be checked, and if the materials lack reliability, they should not be used as evidence of classification.

Results of biological tests which were performed according to internationally recognized test guidelines (for example, those of OECD) and GLP and judged to be valid by reviews of experts in national committees, etc., shall be treated in the same way.

List 3:
These are databases for searching primary literatures and reference databases. In the case where data are available in List 1 or 2, these databases should be referred to for confirmation of the data reliability, if appropriate.
Although hazard information of an individual product is available from existing SDSs, etc., its use for GHS classification should be avoided if it is impossible to evaluate the reliability of individual information.

3-1) Database for primary literatures

- Pub-Med/NLM (for original literature)
- NLM TOXNET (TOXLINE On-line database including original literature)
- JICST of Japan Science and Technology Agency (JDreamII online database)
  [Link: http://pr.jst.go.jp/db/db.html]

3-2) General information database on chemical substances

- National Institute of Technology and Evaluation “Chemical Risk Information Platform” (CHRIP):
  [Link: http://www.safe.nite.go.jp/english/db.html]
- Institut für Arbeitsschutz der Deutschen Gesetzlichen Unfallversicherung (IFA)
  “GESTIS-database on hazardous substances” (GESTIS):
- Ministry of the Environment Government “Chemical Substances Fact Sheets”:
  [Link: http://www.env.go.jp/chemi/communication/factsheet.html] (Japanese text only)
- National Institute for Environmental Studies “WebKis-Plus Chemical Substances Database” (WebKis-Plus):
  [Link: http://w-chemdb.nies.go.jp/] (Japanese text only)
- National Institute of Advanced Industrial Science and Technology (AIST)
  “Risk Assessment Documents”:
  [Link: http://unit.aist.go.jp/risss/crm/mainmenu/e_1.html]
- Chemicals Evaluation and Research Institute, Japan (CERI)
  “Chemical Substance Hazard Data”:
  [Link: http://www.cerij.or.jp/evaluation_document/Chemical_hazard_data.html]
- Hazardous Substance Fact Sheet
  (New Jersey Department of Health and Senior Services):
  [Link: http://web.doh.state.nj.us/rtkhfs/indexfs.aspx]
- U.S. National Institute for Occupational Safety and Health (NIOSH) “RTECS [Registry of Toxic Effects of Chemical Substances]” (RTECS):
  [Link: http://www.cdc.gov/niosh/npg/npgdrttec.html]

It should be noted that substances listed in the above URL are only small part of RTECS.
Information about acute toxicity included in RTECS can be searchable in ChemIDplus of TOXNET (http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?CHEM) RTECS database offered in the paid search site STN: the Scientific and Technical Information Network run by Japan Association for International Chemical Information provides information published regarding almost all substances.

- WHO/IPCS “International Chemical Safety Cards” (ICSC):
  http://www.cdc.gov/niosh/ipcs/icstart.html
  (ICSC Japanese version: http://www.nihs.go.jp/ICSC/)

3-3) EU classification

- Classification based on Table 3-1, Annex VI of EU CLP regulations (hereinafter referred to as “EU CLP classification”. R-phrases are of EU DSD classification) can be reference for GHS classification.

Fundamentally, classification shall be performed based on quality, reliability, and consistency of evidence obtained from the information source, with the evidence weighted and expert judgment added where appropriate.

In this guidance, classification based on the Annex VI of EU CLP regulations is referred to as EU CLP classification, and R-Phrase is referred to as EU DSD classification. EU classification refers to both EU CLP classification and EU DSD classification, unless otherwise specified.

There are available information sources other than the one stated above. For example, the following information sources were adopted by the expert review meeting for GHS classification by Ministry of Health, Labour and Welfare (carried out by Japan Industrial Safety and Health Association).

Organization: National Institute for Occupational Safety and Health (NIOSH)

“NIOSH Publications ; Criteria Documents”
http://www.cdc.gov/niosh/pubs/criteria_date_desc_nopubnumbers.html

“NIOSH Pocket Guide to Chemical Hazards”
http://www.cdc.gov/niosh/npg/
3-1-2 Order of precedence when multiple data exist

(1) Order of precedence when multiple data exist among information sources in List 1
   A) Data obtained from tests which were performed according to internationally recognized
ten guidelines (e.g. OECD) and GLP take precedence.
   B) If there are no data falling under A), data obtained from tests which were performed
   according to internationally recognized test guidelines (e.g. OECD) of which compliance
   to GLP is unknown take precedence.
   C) In case classification is difficult based on the data reliability like the above A) and B),
data considered to have the highest scientific validity shall be adopted after examination of
   recency of data, dosage selection in the test, selection of test animal species, validity of the
   administration route, etc. Expert judgment shall be sought for if decision is difficult.

(2) Order of precedence when multiple data exist among information sources other than List 1
   A) Among data collected from other information sources (e.g. information sources shown in
   List 2), data considered to be reliable (data in accordance with GLP, or data for which
   supporting data are clearly indicated and evaluated, data considered to have the highest
   scientific validity after examination of dosage selection in the test, selection of test animal
   species, validity of the administration route, etc.) shall be adopted. This decision procedure
   shall be the same as that in (1).
   B) In this case, the recency of assessment documents and databases or the reliability of cited
   documents shall be considered.
   C) For classification, it is required to evaluate and judge the reliability and validity of data
   comprehensively. Expert judgment shall be sought for if classification is difficult when
   data reliability is unknown.
3-1-3 Management of information in special cases

The following should be noted for the management of analogous compounds and epidemiological information.

(1) Evaluation of analogous compounds

In general, the search, collection, and assessment of hazard data are limited to a substance that can be identified by CAS number and not to its analogous compounds (different molecular species) such as metals, salts, anhydrides, hydrates, and isomers, because they have different solubility, biological absorption, biological activity, etc., and may cause different manifestation of health hazards, even if they are analogous substances.

While sufficient hazard data may not be available for some substance classified substance, they may be available for its analogous substance. In such a case, it shall be written that "On health hazards refer to ID XXXX, Name of the substance, CAS No. ZZZZ-ZZ-Z" to indicate the existence of another substance to be referred. This phrase may be entered in the column of "classification evidence" for the first item of health hazards, namely, “Acute Toxicity (oral)” in the GHS classification list. Also, as for a chemical (to be identified by CAS number) including plural isomers such as racemic isomers, when a mixture (for example, racemic isomers) has less information but when an isomer has sufficient information, classification is carried out based on the data of the isomer, and “Based on data of XXX isomer” shall be entered in the column for classification evidence.

Regarding carcinogenicity, when an assessment result by IARC is available for “the substance in question and its compounds” even if not for the exact substance in question that can be identified by its CAS number, that carcinogenicity assessment result shall be adopted. In addition, as for analogous compounds, care should be taken because the assessment results may differ for compounds determined as an excluded substance and between its inorganic salt and organic salt (refer to the corresponding examples).

A) If hazard assessment results are definitely different among different state/shapes, they should be listed.

Example: Carcinogenicity of lead

<table>
<thead>
<tr>
<th>Type of lead compound</th>
<th>GHS classification</th>
<th>IARC’s assessment as an evidence</th>
<th>Year of IARC assessment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lead</td>
<td>Category 2</td>
<td>2B</td>
<td>1987</td>
</tr>
<tr>
<td>Inorganic lead compound</td>
<td>Category 1B</td>
<td>2A</td>
<td>2006</td>
</tr>
</tbody>
</table>
B) If hazard assessment results are not clear depending on the states/shapes, notes shall be added to the classification as evidence.

Example: Carcinogenicity of cadmium
GHS classification: Category 1A
According to IARC (1993), “as cadmium and its compounds"

(2) Regarding treatment of epidemiological data

In many cases, it is difficult to judge whether a substance should be included based on epidemiological data. However, if the epidemiological data are obtained by searching the information sources shown in this guidance by CAS number, and if assessment is performed for the material group including its analogous compounds but not for the substance that can be identified by its CAS number, such hazard information can be adopted.

Epidemiological data may not be suitable for GHS Categories in which definitions are quantitative, in proportion to the strength of an effect (for example, Acute Toxicity). Management of epidemiological data in CMR (Carcinogenicity, Mutagenicity, and Reproductive Toxicity) is shown below, in which categories are set in accordance with the reliability of evidence.

■ Regarding treatment of epidemiological data in CMR

A) As for human epidemiological data, substances that were evaluated in assessment documents shown in List 1, shall be classified according to the assessment results.

B) If assessment results based on the same type of epidemiological data differ, or assessment results based on different type of epidemiological data differ, the result of the latest assessment document takes precedence.

C) When available epidemiological data are limited to that of assessment documents in other than List 1, as well as regarding the treatment of specific epidemiological data, judgment by experts in this fields shall be sought for.

(3) Conversion table of concentration in diet to dosage per body weight in animal tests

Regarding Specific Target Organ Toxicity (Repeated Exposure) and Reproductive Toxicity, when only the description of the concentration in the diet is available in an animal test report, the dosage per body weight shall be obtained from the concentration in the diet according to the table below (quoted and partially revised from Environmental Health Criteria, No. 104, 1990, p.113). In this case, further conversion is not required in consideration of the body weight of the animal.
Table 3-1-3-1: Relation between concentration in diet (ppm) and dosage per body weight (mg/kg weight /day)

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Lehman, A.J. (1954) Association of Food and Drug Officials Quarterly Bulletin, 18: 66, partially revised. Values in this table are the average of values obtained from many literatures.

(Example) In cases of rats, what are the values in ppm and mg/kg body weight /day of a substrate which is contained in diet by 0.5%?

(Solution) 0.5% is equal to 5000 ppm. From the table, in cases of matured rat, 1 ppm in the diet is equivalent to 0.050 mg/kg body weight /day. Consequently, 5000 ppm is equivalent to 250 mg/kg body weight /day (5000×0.050).

3-2 Classification of health hazards

3-2-1 Acute Toxicity

(1) Definitions
Definitions of Acute Toxicity in UN GHS are as follows, and they are adopted in this guidance. However, nonfatal impact on internal organ of single exposure will be treated as specific target organ toxicity (single exposure), instead of as acute toxicity.

【GHS 4th revised edition】 (3.1.1)

**Acute toxicity** refers to those adverse effects occurring following oral or dermal administration of a single dose of a substance, or multiple doses given within 24 hours, or an inhalation exposure of 4 hours.

(2) Classification criteria

A) Classification criteria based on Classification JIS

<table>
<thead>
<tr>
<th>Exposure route</th>
<th>Category 1</th>
<th>Category 2</th>
<th>Category 3</th>
<th>Category 4</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Oral</strong> (mg/kg bodyweight)</td>

<td>1.0&lt;ATE≤5</td>
</tr>
</tbody>
</table>

The acute toxicity estimate (ATE) for the classification of a substance is derived using any of the following:

(a) existing LD_{50} or LC_{50} judged usable for classification,

(b) the conversion value of acute toxicity range values obtained from table 3-2-1-2 that relates to the results of a range test, or

(c) the conversion value from table 3-2-1-2 that relates to a classification category;

Inhalation ATE values in the table are based on 4 hour testing exposures. Conversion of existing toxicity data which has been generated according to 1 hour exposures should be by dividing by a
factor of 2 for gases and vapours and 4 for dusts and mists.

For some substances the test atmosphere will not just be a vapour but will consist of a mixture of liquid and vapour phases. For other substances the test atmosphere may consist of a vapour which is near the gaseous phase. In these latter cases, classification should be based on ppmV (volume fraction) as follows: Category 1 (100 ppmV), Category 2 (500 ppmV), Category 3 (2500 ppmV), and Category 4 (20000 ppmV).

Note 1: Gases concentrations are expressed in parts per million by volume (ppmV).
Note 2: Dust is generally formed by mechanical processes. Mist is generally formed by condensation of supersaturated vapours or by physical shearing of liquids. Dusts and mists generally have sizes ranging from less than 1 to about 100 µm.

Note a) Vapour: the gaseous form of a chemical released from its liquid or solid state.

b) Dust: Solid particles of a chemical suspended in a gas (usually air).
c) Mist: Liquid droplets of a chemical suspended in a gas (usually air).

Note 3: ATE, an abbreviation of Acute Toxicity Estimates refers to both acute toxicity value and acute toxicity estimate.

Table 3-2-1-2: Conversion from experimentally obtained Acute Toxicity range values (or Acute Toxicity hazard categories) to Acute Toxicity point estimates for classification for the respective routes of exposure

</tbody>
</table>

Note 1  Gases concentration are expressed in parts per million per volume (ppmV).

Note 2  These values are designed to be used in the calculation of the Acute Toxicity estimate (ATE) values for classification of a mixture based on its ingredients and do not represent test results. The values are conservatively set at the lower end of the range of Categories 1 and 2, and at a point approximately 1/10th from the lower end of the range for Categories 3 and 4.

Classification JIS assigns acute toxicity of chemical substances from oral, endermatic or inhalation route to one of four toxicity classes.

B) Classification criteria in GHS (reference information)

In GHS classification, in addition to Classification JIS, Category 5 is set. Explanation of classification criteria by GHS and Category 5 are as follows.
Table 3.1.1: Acute toxicity hazard categories and acute toxicity estimate (ATE) values defining the respective categories

<table>
<thead>
<tr>

</tbody>
</table>

**Note:** Gases concentration are expressed in parts per million per volume (ppmV).

**Notes to Table 3.1.1:**

(a) The acute toxicity estimate (ATE) for the classification of a substance is derived using the \(LD_{50}/LC_{50}\) where available;

(b) The acute toxicity estimate (ATE) for a substance in a mixture is derived using:
   
   (i) the \(LD_{50}/LC_{50}\) where available; otherwise,  
   
   (ii) the appropriate conversion value from Table 3.1.2 that relates to the results of a range test, or  
   
   (iii) the appropriate conversion value from Table 3.1.2 that relates to a classification category;

(c) Inhalation cut-off values in the table are based on 4 hour testing exposures. Conversion of existing inhalation toxicity data which has been generated according to 1 hour exposures should be by dividing by a factor of 2 for gases and vapours and 4 for dusts and mists;
(d) It is recognized that saturated vapour concentration may be used as an additional element by some regulatory systems to provide for specific health and safety protection. (e.g. UN Recommendation for the Transport of Dangerous Goods);

(e) For some chemicals the test atmosphere will not just be a vapour but will consist of a mixture of liquid and vapour phases. For other chemicals the test atmosphere may consist of a vapour which is near the gaseous phase. In these latter cases, classification should be based on ppmV as follows: Category 1 (100 ppmV), Category 2 (500 ppmV), Category 3 (2500 ppmV), Category 4 (20000 ppmV)

The terms “dust”, “mist” and “vapour” are defined as follows:

(i) Dust: solid particles of a substance or mixture suspended in a gas (usually air);
(ii) Mist: liquid droplets of a substance or mixture suspended in a gas (usually air);
(iii) Vapour: the gaseous form of a substance or mixture released from its liquid or solid state.

Dust is generally formed by mechanical processes. Mist is generally formed by condensation of supersaturated vapours or by physical shearing of liquids. Dusts and mists generally have sizes ranging from less than 1 to about 100μm;

(f) The values for dusts and mists should be reviewed to adapt to any future changes to OECD Test Guidelines with respect to technical limitation in generating, maintaining and measuring dust and mist concentrations in respirable form;

(g) Criteria for Category 5 are intended to enable the identification of substances which are of relatively low acute toxicity hazard but which under certain circumstances may present a danger to vulnerable populations. These substances are anticipated to have an oral or dermal LD50 in the range of 2000-5000 mg/kg bodyweight and equivalent doses for inhalation. The specific criteria for Category 5 are:

(i) The substance is classified in this Category if reliable evidence is already available that indicates the LD50 (or LC50) to be in the range of Category 5 values or other animal studies or toxic effects in humans indicate a concern for human health of an acute nature.

(ii) The substance is classified in this Category, through extrapolation, estimation or measurement of data, if assignment to a more hazardous category is not warranted, and:

- reliable information is available indicating significant toxic effects in humans; or
- any mortality is observed when tested up to Category 4 values by the oral, inhalation, or dermal routes; or
- where expert judgement confirms significant clinical signs of toxicity, when tested up to Category 4 values, except for diarrhoea, piloerection or an ungroomed appearance; or
- where expert judgment confirms reliable information indicating the potential for significant acute effects from other animal studies.

Recognizing the need to protect animal welfare, testing in animals in Category 5 ranges is
(3) Items on information sources and data

* Classification procedure can be referred to "3-1-1 Sources of Information available for classification".

A) Data availability

- Classification should be performed based on the toxicity values reported in information available for classification.
- Since the information sources mainly consist of review information, the same Acute Toxicity data are often cited in multiple reviews. If the same Acute Toxicity value is found, check the original document and avoid overlapping of the same data.
- OECD test guidelines include the following test methods relating to Acute Toxicity.
  - OECD TG 420  Acute oral toxicity – Fixed dose procedure
  - OECD TG 423  Acute oral toxicity – Acute toxic class method
  - OECD TG 425  Acute oral toxicity – Up-and-down procedure (UDP)
  - OECD TG 402  Acute dermal toxicity
  - OECD TG 403  Acute inhalation toxicity
  - OECD TG 436  Acute Inhalation Toxicity - Acute Toxic Class Method
- EU CLP classification criteria completely accord with that of GHS in JIS classification. On the European Commission website, EU harmonized CLP and DSD (Dangerous Substances Directive) classification results are shown in Table 3-1, Annex VI and Table 3-2, Annex VI, respectively, which are referable. [http://ec.europa.eu/enterprise/sectors/chemicals/documents/classification/index_en.htm](http://ec.europa.eu/enterprise/sectors/chemicals/documents/classification/index_en.htm)
- Hazard statements\(^6\) regarding acute toxicity (H300, H301, H302, H310, H311, H312, H330, H331, and H332) of EU CLP classification and R-Phrase 20, R-Phrase 21, R-Phrase 22, R-Phrase 23, R-Phrase 24, R-Phrase 25, R-Phrase 26, R-Phrase 27, and R-Phrase 28 (hereinafter abbreviated as R20\(^7\) and the like) regarding acute toxicity of EU DSD classification are referable.

B) Order of Precedence where multiple data exist

Refer to “3-1-2 Order of Precedence where multiple data exist”.

C) Comparison with conventional classification systems

- EU DSD classification may be referred to as a rough guide but does not accords with GHS

---

\(^6\) See Annex for EU hazard statements.
\(^7\) For R-Phrase, see Appendix.
completely.

- In EU CLP Regulations Annex VII, conversion to the Acute toxicity of GHS classification is made using the r-phrases and symbol mark of EU DSD classification as shown in the following table.
- UNRTDG Division 6.1 is not sub-categorized by exposure route.

<td>0.25</td>
<td>R23</td>
</tr>
</tbody>
</table>

(Note) "Oral" and “Dermal” are LD₅₀ values, and “Inhalation; vapours” and “Inhalation; dusts and mists” are LC₅₀ values. “Inhalation; gases” is not defined in the present EU DSD classification.

D) Guidance concerning data

It should be noted that unit of inhalation toxicity data varies depending on the properties of the substance. Classification should be performed on the basis of the values for gases (ppmV) if the test atmosphere consists of a gaseous phase including vapour that is substantially a gaseous phase, values for vapours (mg/L) if the test atmosphere consists of a liquid with a relatively low boiling point, and values for mists (mg/L) for other cases.
(Reference) Conversion of ppmV and mg/L units (at 25°C and atmospheric pressure)

\[
\text{ppmV} = \left\{ \left( \frac{\text{mg/L}}{24.45 \times 10^3} \right) \times \text{molecular weight} \right\} / \text{molecular weight}
\]

\[
\text{mg/L} = \left\{ \left( \frac{\text{ppmV}}{10^{-3}} \right) \times 24.45 \right\} / \text{molecular weight}
\]

(4) Guidance for classification and judgment

A) Background of this item and points to be noted

Refer to Part 1, Introduction for background of this item.

GHS classification of which only mixture data are available (limited to mixed or diluted with solvents without toxicity) as chemical substances is performed by appropriately estimating corresponding values from concentrations, and the estimation processes should be described.

In any case, a substance which is applicable to “Category 5” of UN GHS classification is judged “Not classified” in the Classification JIS. Therefore, “Not classified” in the Classification JIS (Category 5 of UN GHS classification) shall be indicated.

B) Decision when there are multiple descriptions related to Acute Toxicity

When multiple descriptions related to Acute Toxicity with highly reliable data are available, and when they fall under multiple categories, in principle, the category is determined according to “3-1-2 Order of Precedence when Multiple Data Exist”. However, when the substance falls under multiple categories under the above order of precedence, the category under which the greatest number of data fall is adopted.

In addition, if the numbers of data for the categories thus singled out are the same, the category with higher hazard is adopted.

(Methods to classify mixtures by using categorization results include a method using conversion values in Table 3-2-1-2 based on the determined category and a method using values considered to be appropriate (the smallest one is adopted) among data shown in the classification reason.)

C) Considerations for assessing the Acute Toxicity LC50 in inhalation route

1) Values for inhalation toxicity are based on 4 hour tests in laboratory animals. In the case multiple values exist, one should be selected according to the method described in "3-2-2 Order of precedence when multiple data exist ". If their reliability is equivalent, the most appropriate values shall be adopted based on the following criteria; values other than 4 hour tests shall be converted to a 4-hour equivalent.

a) Data based on the 30 minutes to 24 hour test shall be used. Data close to 4 hour test shall be prioritized.

b) If data satisfying the condition a) are not available, the substance is classified as
“Classification not possible”. However, a substance which shows lethal effect by exposure of 4 hours or less (including less than 30 minutes) with the concentration of the criterion value or below for Category 1 (determined by ATE/ LC\text{50}) is classified as Category 1 (inhalation).

Method for converting LC\text{50} value B for A hours into LC\text{50} estimate value D for C hours:

- Gas/vapour: \( D = \frac{B \sqrt{A}}{\sqrt{C}} \)
- Dusts/Mist: \( D = \frac{BA}{C} \)

* When performing GHS classification, enter 4 (hours) for C.

(Regarding conversion) When an experimental value is adopted from the 1-hour exposure test, it shall be converted into a 4-hour equivalent by dividing the 1-hour value by a factor of 2 in the case of gas and vapour and by a factor of 4 in the case of dust and mist. The experimental values other than for 1 hour are not described in the GHS text, but LC\text{50} in 4 hours necessary for applying the GHS classification shall be obtained by using the above arithmetic formula.

2) In some cases, it is not clear whether the adopted data is from the vapour inhalation test or mist inhalation test. In such cases, the substance shall be determined as “Classification not possible” unless the obvious conclusion can be given based on physical properties such as vapour pressure. The reason why the decision cannot be made shall be clearly described, for example, “If the test condition is vapour, the substance is determined to fall under Category ○○, and, if it is mist, it falls under category △△. But it cannot be determined whether it is vapour or mist based on information obtained; therefore the substance is determined as “Classification not possible”.

3) Although a substance is mist, its LC\text{50} may be described in ppmV, or for gas, its LC\text{50} may be described in mg/L. In many assessment documents, LC\text{50} values without test conditions such as temperature are found. If an accurate conversion is not possible, conversion shall be performed according to the following formula.

\[
\text{ppmV} \approx \frac{\text{mg/L} \times 1000 \times 24.45}{\text{molecular weight}} \quad \text{(for conversion at } 25^\circ\text{C and atmospheric pressure)}
\]

(Example) Saturated vapour pressure for certain substance is 0.9 kPa (25°C). What is the saturated vapour pressure concentration for this substance (ppm) ?

(Answer) Saturated vapour pressure concentration = Saturated vapour pressure / atmospheric pressure

Saturated vapour pressure concentration = 0.9 kPa / 101.3 kPa

\[
= 0.0088845
\]
= 8885 ppm

Therefore, the saturated vapour pressure concentration of a substance that has a saturated vapour pressure of 0.9 kPa (25°C) is 8885 ppm. When calculating in mmHg, atmospheric pressure should be converted to 760 mmHg.
Figure 3-2-1-1 Handling of animal species difference

Is route oral or by inhalation?

Yes

Is rat data available?

Yes

Determined based on the rat data

No

Determined as "Classification not possible"*1

Are Rodent (mouse, guinea pig) data available?

Yes

Determined based on the rat data. If data of multiple kinds of species are available, adopt one with the smallest value.

No

Determined as "Classification not possible"*2

Is route dermal?

Yes

Are rat or rabbit data available?

Yes

Determined based on the rat or rabbit data. If both data are available, calculate for each species, and adopt the one with the smaller value.

No

Determined based on the rodent data. If data of multiple kinds of species are available, adopt one with the smallest value.

Are rodent (mouse, guinea pig) data available?

Yes

Determined as "Classification not possible"*2

No

Determined as "Classification not possible"*2

*1 Data for animals other than rodents are not adopted for classification but are described in the input sheet for future reference.

*2 Data for animals other than rodents and rabbits are not adopted for classification but are described in the input sheet for future reference.

D) Reference Value regarding Vapour inhalation in Acute Toxicity classification

Since, in the classification of Acute Toxicity, the criteria for vapour inhalation are easily misunderstood when one refers only to Table 3.1.1. of the UN GHS 4th revised edition, it is required for classification to take notice of note (e) of Table 3.1.1. and the text paragraph 3.1.2.6.2 of the same document.

Note (e) attached to the column of “Vapour” in Table 3.1.1 of the UN GHS 4th revised edition states, “For some substances, the test atmosphere will not just be a vapour but will consist of a mixture of liquid and vapour phases. For other chemicals, the test atmosphere may consist of a vapour which is near the gaseous phase. In these latter cases, classification should be based on ppmV as follows: Category 1 (100 ppmV), Category 2 (500 ppmV), Category 3 (2500 ppmV), and Category 4 (20000 ppmV). ”This instructs that, if a test is conducted with vapour that is completely gasified, classification is made with the reference value shown in ppm,
whereas the reference value is set in mg/L in the column of vapour inhalation of the main body of the table since a test described as conducted for “vapour” actually has “inclusion of mist” in some cases, in which cases the concentration cannot be indicated accurately unless indicated in mg/L. The values shown here are the same as the classification reference values of gases. In text 3.1.2.6.2, the same point is repeatedly described.

In line with Note (d) of Table 3.1.1 and the gist of the paragraph 3.1.2.6.2 of the UN GHS 4th revised edition, classification of acute toxicity in the case of “inhalation” shall be performed as follows.

1) As for gas based on the definition of GHS (defined as “a substance which (i) at 50°C has a vapour pressure greater than 300 kPa (absolute); or (ii) is completely gaseous at 20°C at a standard pressure of 101.3 kPa”), the category reference values (ppmV) of gas are applied.

2) When an experiment with regard to vapour generated from liquids is performed with concentration exceeding the saturated vapour pressure, the substance is determined as “mists”, and the category reference values of “dusts and mists” are applied.

3) When an experiment is performed at the concentration of the saturated vapour pressure or less with the vapour generated from liquids, the substance is handled as “vapours”. When handled as "vapours", since there are cases where mists are estimated to be included and where mist is estimated to be hardly included in accordance with GHS, categorization is performed based on the following a) to d).

a) When mists are estimated to be included, categorization is performed based on the reference values in the unit of mg/L shown in the row of “vapours” in the Table.

b) When mist is estimated to be hardly included, categorization is performed based on the reference values (the same values as for gases) in the unit of ppmV shown in the Note (d) of UN GHS 4th revised edition Table 3.1.1.

c) When the ATE (LC50) value obtained from a test is between the value for the saturated vapour pressure concentration of the substance and a value corresponding to that of the saturated vapour pressure concentration, the substance is determined as “vapour with included mists” with consideration of the possibility of mist inclusion, and 1) is applied. In case of lower concentration, the substance is determined as “vapour with hardly included mist”, and 2) is applied.

d) When description in a document is in mg/L, values therein are converted into those in ppmV based on the molecular weight and temperature, and the above method is applied. If the temperature during the inhalation test is not described, the unit conversion is performed by assuming that the temperature is 25°C and the volume of gas of 1 mole is 24.45 L.

4) When it is described that a test is conducted definitely for “mists”, the substance tested is treated as mist.
5) Since it is also presumed that vapour generated from solid is inhaled, the vapour which is generated from solid (other than gases/liquids) is treated as “Vapour” when it is clearly indicated as “vapour” or the inhalation concentration is indicated in unit of ppmV. However, when a concentration is at the value of the saturated vapour pressure concentration or greater, dust may be included. Since GHS has no special definition for this case, specify as follows: “Doubtful description as vapour because the described pressure exceeds the saturated vapour pressure: high possibility of dust inclusion”. When a concentration is at the value that corresponds to the saturated vapour pressure or less, and when the unit is mg/L, and when there is no clear indication of vapour or dust, generally, classification is not possible. In this case, it is desirable to indicate specially, “Category ○○ if it is vapour, Category ○○ if it is dust”.
3-2-2 Skin Corrosion/Irritation

(1) Definitions
Definitions of Skin Corrosion/Irritation in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (3.2.1)

Skin corrosion is the production of irreversible damage to the skin; namely, visible necrosis through the epidermis and into the dermis, following the application of a test substance for up to 4 hours. Corrosive reactions are typified by ulcers, bleeding, bloody scabs, and, by the end of observation at 14 days, by discoloration due to blanching of the skin, complete areas of alopecia, and scars. Histopathology should be considered to evaluate questionable lesions.

Skin irritation is the production of reversible damage to the skin following the application of a test substance for up to 4 hours.

(2) Classification criteria
A) Classification criteria based on Classification JIS
The categories of corrosion and irritation are classified into Category 1 Skin Corrosion and Category 2 skin irritation (as will be discussed later, in UN GHS, in addition to Classification JIS, Category 3 is set), and Skin Corrosion is sub-categorized based on exposure time and observation period. Criteria are as follows.

<table>
<thead>
<tr>
<th>Table 3-2-2-1: Skin corrosion category and sub-categories a)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category 1:</strong> Corrosive</td>
</tr>
<tr>

\(a\) The use of human data is discussed in 3.2.2.1 and in the Chapter 1.3 (paragraph 1.3.2.4.7)

(3) Items on information sources and data

* Refer to "3-1-1 Sources of Information available for classification" for classification procedures.

A) Data availability

- The definitions of the categories are based on irritation test results, but there are few data books that contain detailed Draize scores to which GHS criteria can be applied. Classification of substances into sub-categories (1A, 1B, and 1C) under Category 1 is not possible without detailed data; OECD Test Guideline 435 (in vitro membrane barrier test method) provides in vitro test method for classification into skin corrosion sub-categories (1A, 1B, and 1C).

- If it is not easy to obtain appropriate irritation data based on observation results (e.g., average Draize Score values (for each animal) of erythema/eschar or edema), PII (skin primary irritation index), findings such as “Severe”, “Moderate”, “Mild (Slightly)”\(^8\) and others regarding skin corrosion/irritation in test reports can be referred to.

\(^8\) Some observations distinguish “mild” and “slightly”, but in IUCLD, “slightly” is used instead of “mild”.

124
• Hazard statements (H314 and H315) relating to skin corrosion/irritation in EU CLP classification and R-Phrases (R34, R35, R36/38, R37/38, R36/37/38) relating to skin corrosion/irritation in EU DSD classification can be referred to.
• The OECD test guideline includes the following test methods relating to Skin Corrosion/Irritation.
  - OECD TG 404 Acute dermal irritation / corrosion
  - OECD TG 430 In vitro skin corrosion: Transcutaneous electrical resistance test (TER)
  - OECD TG 431 In vitro skin corrosion: Human skin model test
  - OECD TG 435 In vitro membrane barrier test method for skin corrosion
  - OECD TG 439 In Vitro Skin Irritation: Reconstructed Human Epidermis Test Method

B) Order of Precedence when Multiple Data Exist
   Refer to “3-1-2 Order of Precedence when Multiple Data Exist”.

C) Comparison with conventional classification systems
• Substances classified as H314 in EU CLP classification and as R34, R35 corrosive (C) in EU DSD classification fall under Category 1.
• Substances classified as H315 in EU CLP fall under Category 2. Substances classified as Irritant (Xi) with R38 and combination of R-Phrases (R36/38, R37/38, R36/37/38) in EU classification fall under Category 2 or Category 3 (in GHS classification). Confirmation with detailed data is required. If evidence information other than EU DSD classification results is not available, the substance shall be judged “Classification not possible”.
• Comparison between EU classification and GHS classification is as follows.

<table>
<thead>
<tr>
<th>Skin corrosion</th>
</tr>
</thead>
<tbody>
<tr>
<td>EU DSD classification</td>
</tr>
<tr>
<td>EU CLP classification</td>
</tr>
<tr>
<td>GHS classification</td>

<tr>
<th>Skin irritation</th>
</tr>
</thead>
<tbody>
<tr>
<td>EU DSD classification</td>
</tr>
<tr>
<td>EU CLP classification</td>
</tr>
<tr>
<td>GHS classification</td>
</tr>
</tbody>
</table>

Note: According to the criteria, H314 includes Category 1 B and 1 C. However, in EU CLP
Regulations Annex VII, H314 is stated as 1 B.

D) Guidance concerning data

In many cases, findings of test reports are given using the evaluative scale of “severe”, “moderate”, and “mild (slightly)” \(^{12}\), and these can be considered to correspond to Categories 1, 2, and 3, respectively. It is preferable to confirm PII (skin primary irritation index) and the like as far as possible, and to classify the substance in question as moderate (corresponding to PII 3-5) or severe (corresponding to PII 5-8). Also, the corresponding category should be determined at least upon confirming which classification criteria the given existing classification is based on since substances classified as “moderate” based on different classification criteria may cause different degrees of skin reaction. Category 1 is applied to substances that cause irreversible lesions such as necrosis within observation period of Skin Corrosion/Irritation test. There is an opinion to the effect that “a substance evaluated as “severe” corresponds to Category 2 if no irreversible lesion is observed”. This judgment, however, may be subjective and should be considered only for reference. It is preferable for GHS classification to refer to the original literatures, to examine the validity of data, and to perform classification based on scientific evidence and methods of GHS.

</tr>
</tbody>
</table>

\(^{*}\)("Not classified” in Classification JIS)

E) Decision by physicochemical properties

\(^{12}\) Some observations distinguish “mild” and “slightly”, but in IUCLD, “slightly” is used instead of “mild”.
Substances considered as strong acids (pH \leq 2) or strong alkalis (pH \geq 11.5) based on their physicochemical properties shall be classified as Category 1. However, in this case, as described in the UN GHS 4th revised edition, it must be shown that its buffer power maintains pH on exposure. In classification, buffering capacity of acids and bases should be taken into account.

(4) Guidance for classification and judgment
A) Background of this item and points to be noted
Refer to Part 1, Introduction for the background of this item.
Classification with regard to skin corrosion and irritation shall be conducted according to the workflow of decision logic 3.2.1 that is the clear criteria of UN GHS 4th revised edition. In classification, refer to the technical advices such as judging method based on pre-existing test data described below.
Sub-categorization of Corrosion can be performed only when an animal test is conducted that has exposure time and observation period which allow application of the judgment of corrosion in the UN GHS 4th revised edition (Table 3.2.1). Accordingly, only for such cases, sub-categorization is performed, and for other cases, sub-categorization should not be performed.
In addition, note the following in classification.
* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, determination of "Not classified" should be performed carefully. If there is any question, not “Not classified” but “Classification not possible” is preferable, which is based on the absence of sufficient information for judging.
* When sub-categorization is not possible, the substance shall be classified as “Category 1”.
A substance which is applicable to “Category 3” of UN GHS classification is judged “Not classified” in the Classification JIS. Therefore, “Not classified” in the Classification JIS (Category 3 of UN GHS classification) shall be indicated.

B) Judgment by reliable existing revelation course
When a substance has cases to be judged as corrosion (any of sub-categories 1A, 1B, and 1C, or Category 1) or irritation (Category 2) in human or animal results, the substance shall be classified as such. (Example: accidental cases)

C) Judgment by existing test data
1) Decision by in vivo test result:
   ■ Corrosion: (any of sub-categories 1A, 1B, and 1C, or Category 1)
In at least 1 of 3 tested animals after exposure for up to 4 hours:

a) Necrosis into the dermis.
b) Ulcer, bleeding, or bloody scabs in the applied area.
c) Blanching of the skin, complete areas of alopecia, and remaining scars are found at the end of the observation period of 14 days.
d) In the case of erythema/eschar or edema score of 4 or more, the substance is determined as Corrosion (Category 1) (When, however, no irreversible lesion is found, the substance is determined as Irritation (Category 2)).

**Irritation (Category 2)**

At 24, 48, and 72 hours after application:

a) Mean value of Draize Score (for each animal) \( (S) \) is \( \geq 2.3 \) to \( \leq 4.0 \) for erythema/eschar or edema in at least 2 of 3 tested animal,
b) Inflammation and alopecia of limited area, hyperkeratosis, hyperkeratosis, hyperplasia, and scaling persist to the end of 14 days after application in at least 2 of 3 tested animal, or
c) In some cases where there is pronounced variability of response among animals, with very definite positive effects related to chemical exposure in a single animal but less than the criteria above.

2) Decision by comparison with existing classification:

- The substance classified as Severe or Corrosive is determined as Corrosive (Category 1), and the substance classified as Severe with no irreversible lesion observed is determined as Irritant (Category 2).
- The substance classified as Moderate is determined as Irritation (Category 2). It should be noted that since IUCLID has no classification category of “Mild” and uses “Slightly”, slight irritation shall be classified as “Not classified” (Category 3 of UN GHS classification criteria).
- It is preferable to confirm PII (skin primary irritation index) and the like as far as possible, and to classify the substance in question as moderate (corresponding to PII 3-5) or severe (corresponding to PII 6-8). Also, it is preferable to determine the corresponding category at least upon confirming which classification criteria the given existing classification is based on since substances classified as “moderate” based on different classification criteria may cause different degrees of skin reaction.

3) Decision by symptom (when no other information is available):

- When described as necrosis, the substance is determined as corrosive (Category 1).

**D) Decision by structure-activity relationship**

In principle, this need not be taken into account in classification. However, if there is a
description that “the substance is judged applicable to XX class by the analysis of the structure-activity relationship” in the assessment document of List 1, it is classified based on the result.

E) Decision by physicochemical properties

In the case of pH ≤ 2 and pH ≥ 11.5, the substance is classified as Corrosive (Category 1) (Determination is performed with buffering capacity also taken into account.) (Booman et al. (1989) proposed 0.2 meq HCl/g for eye irritation.)

A paper is given below that shows examples that irritation is not determined by pH alone but affected by composition of acids or alkalis.

“Classification as Corrosive or irritant to Skin of Preparations Containing Acidic or Alkaline Substances, without Testing on Animals”, YOUNG J, et. al. (SDA), Toxicol in vitro VOL.2 NO.1 PAGE 19-26 (1988)

F) Decision by in vitro test methods

If data of a test based on OECD TG431 (human skin model, Epiderm), TG430 (skin electric conductivity test), OECD TG435 (Corrositex®), or OECD TG439 (In Vitro Skin Irritation: Reconstructed Human Epidermis Test Method) is available, the substance shall be classified in accordance with the decision criteria with which each of the test is internationally accepted. Other in vitro tests are not considered.

G) Strategy of tiered testing and evaluation for skin corrosion and skin irritation

The strategy of tiered testing and evaluation for skin corrosion and skin irritation described in the UN GHS 4th revised edition (3.2.1) is as follows. In principle structure-activity relationships (Steps 2a and 2b) need not be adopted in this guidance as shown in D).

Necessity of revision of this flow diagram has been discussed in the “United Nations Sub-Committee of Experts on the Globally Harmonized System of Classification and Labeling of Chemicals (UNSCEGHS)”.

   Positive response \(\rightarrow\) Classify as irritant\(^{(a)}\)
   No further testing \(\rightarrow\) No further testing, not classified
   \(\downarrow\)
   Negative response

9 When it is ethical to perform human patch testing\(^{(g)}\)
   Positive response \(\rightarrow\) Classify as irritant\(^{(a)}\)
   \(\downarrow\)
   Not as above
   Negative response \(\rightarrow\) No further testing, not classified
(Notes for the above figure)

(a) Classify in categories shown in (2) B.

(b) In principle, structure-activity relationships are not adopted in this guidance.

(c) Measurement of pH alone may be acceptable, but assessment of acid or alkali reserve is preferable; methods are needed to assess buffering capacity.

(d) Pre-existing animal data should be carefully reviewed to determine if in vivo skin corrosion/irritation testing is needed. For example, testing may not be needed when a test material has not produced any skin irritation in an acute skin toxicity test at the limit dose, or produces very toxic effects in an acute skin toxicity test. In the latter case, the material would be classified as being very hazardous by the dermal route for acute toxicity. It is moot whether the material is also irritating or corrosive on the skin. It should be kept in mind in evaluating acute skin toxicity information that the reporting of skin lesions may be incomplete, testing and observations may be made on a species other than the rabbit, and species may differ in sensitivity in their responses.

(Note) The OECD test guidelines defining limit dose and the limit dose is shown below.

<table>

(e) Examples of internationally agreed in vitro test methods for skin corrosion are OECD TG 430, TG 431 and TG 435; see “F) Decision by in vitro test methods”.

(f) An example of internationally agreed in vitro test methods for skin irritation is OECD TG 439; see “F) Decision by in vitro test methods”.

(g) This evidence can be derived from single or repeated exposures. There is no internationally accepted test method for human skin irritation testing, but an OECD TG has been proposed.

(h) Testing is usually conducted in 3 animals, one coming from the negative corrosion test.
3-2-3 Serious Eye Damage/Eye Irritation

(1) Definitions
Definitions of Serious Eye Damage/Eye irritation in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (3.3.1)

*Serious eye damage* is the production of tissue damage in the eye, or serious physical decay of vision, following application of a test substance to the anterior surface of the eye, which is not fully reversible within 21 days of application.

*Eye irritation* is the production of changes in the eye following the application of test substance to the anterior surface of the eye, which are fully reversible within 21 days of application.

(2) Classification criteria

A) Classification criteria based on Classification JIS

**Table 3-2-3-1: Irreversible eye effects categories**

An eye irritant Category 1 (irreversible effects on the eye) is a test material that produces:

a) at least in one animal, effects on the cornea, iris, or conjunctiva that are not expected to reverse or have not fully reversed within an observation period of normally 21 days; and/or

b) at least in 2 of 3 tested animals, a positive response of:

- corneal opacity $\geq 3$; and/or
- iritis $>1.5$ ;

calculated as the mean scores following grading at 24, 48, and 72 hours after installation of the test material.

**Table 3-2-3-2: Reversible eye effects categories**

An eye irritant Category 2A (irritating to eyes) is a test material that produces:

at least in 2 of 3 tested animals, a positive response of:

- corneal opacity $\geq 1$; and/or
- iritis $\geq 1$; and/or
- conjunctival redness $\geq 2$; and/or
- conjunctival oedema (chemosis) $\geq 2$

calculated as the mean scores following grading at 24, 48, and 72 hours after installation of the test material, and which fully reverses within an observation period of normally 21 days.

Within this category, an eye irritant is considered mildly irritating to eyes (Category 2B) when the effects on eyes are fully reversible within 7 days of observation.
B) Classification criteria in GHS

In classification criteria of Classification JIS and that of GHS, the same categories are adopted.

(3) Items on information sources and data

* Classification procedure can be referred to "3-1-1 Sources of Information available for classification".

A) Data availability

- The definitions of the categories are based on eye irritation test results, but there are few data books that contain detailed Draize scores to which GHS classification criteria can be applied.

- For skin corrosive materials, tests by installation to animal eyes are not conducted generally. In the case where data of eye irritation test are not available, a skin corrosive material shall be classified as a substance causing serious eye damage (Category 1).

- If it is difficult to obtain appropriate irritation data based on observation results (e.g. Draize Score mean values of each animal and AOI: acute ocular irritation index), findings such as “Severe”, “Moderate”, “Mild (Slightly)" and others regarding eye damage/eye irritation in test reports can be referred to. When data in a test report regarding grade of eye irritation reaction (for example, Draize method for rabbit or human findings) is mild and showing full reversibility within 7 days are available, classification may be performed based on them. It is, however, preferable to review the cited original literature, to examine its scientific validity, and then to classify in accordance with the results. Earlier literatures which do not adopt the standardized Draize method may be referred. However, it is preferable to review the cited original literature, to examine its scientific validity, and then to classify in accordance with the results.

- Hazard statements H318 and H319 relating to eye damage/eye irritation in EU CLP classification and R-Phrases (R36, R41, R36/37, R36/38, R36/37/38) relating to serious eye damage/eye irritation in EU DSD classification can be referred to.

- The OECD test guideline provides the following test method relating to serious eye damage/eye irritation.
  
  - OECD TG 405  Acute eye irritation / corrosion
  - OECD TG 437  Bovine Corneal Opacity and Permeability Test Method for Identifying Ocular Corrosives and Severe Irritants
  - OECD TG 438  Isolated Chicken Eye Test Method for Identifying Ocular

---

13 As described in the footnote in 3-2-2 Skin Corrosion/Irritation, some observations distinguish "mild" and "slightly", but in IUCLD, "slightly" is used instead of "mild".

14 For R-Phrase, see Appendix.
Corrosives and Severe Irritants

B) Order of Precedence when Multiple Data Exist

Refer to “3-1-2 Order of Precedence when Multiple Data Exist”.

C) Comparison with conventional classification systems

- Substances classified as R41 in EU DSD classification fall under Category 1.
- Substances classified in R36 and combination of R-Phrases\(^{15}\) (R36/37, R36/38, R36/37/38) in EU classification fall under Category 2.
- EU CLP classification H318 accords with Category 1, and H319 accords with Category 2.

<td>H318</td>
<td>H319</td>
</tr>
<tr>
<td>GHS classification</td>
<td>Category 1</td>
<td>Category 2A</td>
</tr>
</tbody>
</table>

D) Guidance concerning data

In many cases, findings of test reports are given using the evaluative scale of “severe”, “moderate”, and “mild (slightly)\(^{16}\)”, and these can be considered to correspond to Categories 1, 2A, and "B, respectively. Depending, however, on the test method used, application conditions of test materials, and criteria for “severe”, “moderate”, and “mild (slightly)”, the extent of eye reactions may differ. It is preferable to confirm the final findings, as well as to review the cited original literature, and to examine the scientific validity of the classification criteria and the data. From the point of view, Category 1 is applied to substances that cause irreversible effects on such as cornea and iris within the observation period of eye damage/ eye irritation test. A substance evaluated as “Severe” including no irreversible effects fall under Category 2A. If there is distinction between “Mild” and “Slightly” in the findings of test report, a substance evaluated as “Slightly” should be classified as “Not classified”.

\(^{15}\) For R-Phrase, see Appendix.

\(^{16}\) As described in the footnote in 3-2-2 Skin Corrosion/Irritation, some observations distinguish “mild” and “slightly”, but in IUCLD, “slightly” is used instead of “mild”. If there is distinction between “Mild” and “Slightly”, a substance evaluated as “Slightly” should be classified as “Not classified”
(4) Guidance for classification and judgment

A) Background of this item and points to be noted

Regarding the background of this item, refer to Part 1, Introduction.

As for serious eye damage/eye irritation, classification should be conducted according to the workflow of “decision logic 3.3.1” (3.3.5.1), which is the definite decision criteria of UN GHS 4th revised edition. In classification, refer to the technical advices such as judging method based on pre-existing test data described below.

Sub-categorization of eye irritation can be performed only when data is available which shows that the grade of eye irritation reaction which allows the application of the GHS eye irritation judgment (the UN GHS 4th revised edition, table 3.2.2) (for example, Draize method for rabbit or human findings) is mild and showing full reversibility within 7 days. Accordingly, only for such cases, sub-categorization is performed, and for other cases, sub-categorization should not be performed.

In addition, note the following in classification.

* Unless description that definitely denies hazards or recognizes extremely low hazards is available in List 1, determination of “Not classified” should be performed carefully. If there is any question, not “Not classified” but “Classification not possible” is preferable, which is based on the absence of sufficient information for judging.

B) Judgement by reliable existing revelation course

If there is a case that ascribes to a substance irreversible effects on eye (Category 1) or
reversible effects on eye (Category 2) in human or animal results, the substance shall be classified as such. Similarly, if data are available for skin corrosion in human or animal results, the substance shall be classified as a substance having irreversible effects on eyes (Category 1). Refer to the UN GHS 4th revised edition, table 3.3.1 (Example: accidental cases)

C) Judgement by existing reliable test data

1) Decision by in vivo test (Draize test) result:

   a) Decision criteria for serious eye damage (irreversible effects) (Category 1):

      • At least in one animal, effects on the cornea, iris, or conjunctiva that are not expected to reverse or have not fully reversed within an observation period of 21 days after installation of the test material.
      • At least in 2 of 3 tested animals, the calculated mean scores following grading at 24, 48, and 72 hours after installation of the test material are corneal opacity ≥ 3 and/or iritis > 1.5.

   b) Decision criteria for irritation (reversible effects) (Categories 2A, 2B or Category 2):

      • In the Draize test conducted using 3 animals, the calculated mean values of the scores following grading at 24, 48, and 72 hours after installation of the test material are corneal opacity ≥ 1 and/or iritis ≥ 1 and/or conjunctival redness ≥ 2 and/or conjunctival oedema ≥ 2.
      • The effects are fully reversed within an observation period of 21 days.
      • The substance is classified as mildly irritating to eyes (Category 2B) when the above description applies to the substance and the effects reverse within an observation period of 7 days.

2) Decision by existing classifications:

   • A substance which is classified as Severe or Corrosive (corresponding to very strong irritation or corrosiveness corresponding: AOI 80 or more) is classified in Category 1 (When, however, no irreversible lesion is observed, the substance is determined as irritating to eyes (Category 2A)).
   • A substance which is classified as moderate (corresponding to strong irritation: AOI 30-80) is classified as Category 2A.
   • A substance which is classified as Mild (15 ≤ AOI < 30) is classified in Category 2B. It should be noted that since IUCLID has no classification category of “Mild” and uses “Slightly”, slight irritation shall be classified as Category 2B.
   • It is preferable to review the original literature and to confirm irritation to eyes, etc., where possible.

D) Decision by structure-activity relationship
In principle, this need not be taken into account in classification. However, if there is a
description that a substance is judged to be applicable by the analysis of the structure-activity
relationship in the assessment document of List 1, it shall be classified based on the result.

E) Decision by physicochemical properties

In the case of pH ≤ 2 or pH ≥ 11.5, the substance is classified in Category 1 (Determination
is performed with buffering capacity also taken into account.) (Booman et al. (1989) proposed
0.2 meq HCl/g for eye irritation.)

A paper is given below showing examples that irritation is not determined by pH alone but
affected by composition of acids or alkalis.

“Classification as Corrosive or irritant to Skin of Preparations Containing Acidic or Alkaline
Substances, without Testing on Animals”, YOUNG J, et. al. (SDA), Toxicol in vitro VOL.2
NO.1 PAGE 19-26 (1988)

F) Decision by \textit{in vitro} test methods

Examples of internationally accepted validated \textit{in vitro} test methods for eye irritation are
OECD TG 437 and TG438.

G) Strategy of testing and evaluation for Serious Eye Damage/Eye Irritation

The strategy of tiered testing and evaluation for Serious Eye Damage/Eye Irritation
described in the UN GHS 4th revised edition, Figure 3.3.1 is as follows. In principle
structure-activity relationships (Steps 2a, 2b and 2c) need not be adopted in this guidance as
shown in D).

Discussion on the necessity for revising this flow diagram has arisen in the “United Nations
Sub-Committee of Experts on the Globally Harmonized System of Classification and Labeling
of Chemicals (UNSCGHS)”.

(Also, refer to Skin irritation/corrosion test and summary of the results.)

[2a, 2b and 2c are not adopted in this guidance.]
No or don’t know

3a pH/acid or alkaline reserve → pH ≥ 11.5 or pH ≤ 2 (considering acid or alkaline reserve) → Category 1

3b 2 < pH < 11.5 (no buffering potential)

4 Other information indicating the material is a skin corrosive Yes → No evaluation of effects on eyes; deemed to be Category 1

No

5 Is a valid in vitro test available to assess severe damage to eyes

5a In vitro test for severe eye irritation → Severe damage to eyes → Category 1

Not a severe eye irritant

6 Is a valid in vitro test for eye irritation available

6a In vitro eye irritation test → Eye irritant → Category 2

No indication of eye irritant properties

But in vitro test for severe eye irritancy was negative

In the absence of any in vitro test → Go to Step 7

Go to step 6

Go to step 8

Go to Step 7
NOTES to Figure 3.3.1:

Step 1a/b: Data relating to historical human or animal experience: pre-existing information on eye irritation and skin corrosion are shown separately because evaluation of skin corrosion has to be considered if there is no information on local effects on eyes. Analysis of pre-existing experience with the chemical may identify serious eye damage, corrosion and irritation potential for both skin and eye effects:
(i) Step 1a - reliable determination of eye irritancy basing on human or animal experience - depends on expert judgment: in most cases human experience is based on accidental events and thus, the local effects detected after an accident have to be compared with classification criteria created for evaluation of animal test data;
(ii) Step 1b - evaluation of data on skin corrosivity - skin corrosive substances should not be instilled into the eyes of animals; such substances should be considered as leading to serious damage to the eyes as well (Category 1).

Step 2a/b/c [Not adopted in this guidance in principle]: SAR (Structure Activity Relationships) for eye irritation and skin corrosion are shown separately but in reality would probably be done in parallel. This stage should be completed using validated and accepted SAR approaches. The SAR analysis may identify serious eye damage, corrosion and irritation potential for both skin and eye effects:
(i) Step 2a - reliable determination of eye irritancy only by theoretical evaluations – in most cases it will only be appropriate for substances that are homologous to
agents with very well known properties;

(ii) Step 2c - theoretical evaluation of skin corrosivity - skin corrosive substances should not be instilled into the eyes of animals; such substances should be considered as leading to serious damage to the eyes as well (Category 1).

Step 3: pH extremes like \( \leq 2 \) and \( \geq 11.5 \) may indicate strong local effects, especially in combination with assessment of acid or alkaline reserve, substances exhibiting such physico-chemical properties should be considered as leading to serious damage to eyes (Category 1).

Step 4: All attainable information should be used, including human experience. But this information should be restricted to that which pre-exists (e.g. the results of a skin LD_{50} test or historical information on skin corrosion).

Step 5: These must be alternative methods for the assessment of eye irritation/ or serious damage to eyes (e.g. irreversible corneal opacity) which have been validated in accordance with internationally agreed principles and criteria (see section 1.3.2 in Chapter 1.3 of UN GHS 4th revised edition).

Step 6: At present this step seems not to be achievable in the near future. Validated alternative methods for the reliable assessment of (reversible) eye irritation need to be developed.

Step 7: In the absence of any other relevant information, it is essential to obtain this via an internationally recognized corrosion/irritation test before proceeding to a rabbit eye irritation test. This must be conducted in a staged manner. If possible, this should be achieved using a validated, accepted in vitro skin corrosivity assay. If this is not available, then the assessment should be completed using animal tests (see the skin irritation/ corrosion strategy, Chapter 3.2.2 of UN GHS 4th revised edition).

Step 8: Staged assessment of eye irritation in vivo. If in a limit test with one rabbit serious damage to eyes is detected no further testing is needed.

Step 9: Only two animals may be employed for irritation testing (including the one used for evaluation of possible serious effects) if these two animals give concordant clearly irritant or clearly non-irritant responses. In the case of different or borderline responses a third animal is needed. Depending on the result of this three-animal test, classification may be required or not.
3-2-4 Respiratory or Skin Sensitization

(1) Definitions

Definitions of Respiratory or Skin Sensitization in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (3.4.1)

3.4.1.1 A respiratory sensitizer is a substance that will lead to hypersensitivity of the airways following inhalation of the substance.

A skin sensitizer is a substance that will lead to an allergic response following skin contact.

3.4.1.2 For the purpose of this chapter, sensitization includes two phases: the first phase is induction of specialized immunological memory in an individual by exposure to an allergen. The second phase is elicitation, i.e. production of a cell-mediated or antibody-mediated allergic response by exposure of a sensitized individual to an allergen.

3.4.1.3 For respiratory sensitization, the pattern of induction followed by elicitation phases is shared in common with skin sensitization. For skin sensitization, an induction phase is required in which the immune system learns to react; clinical symptoms can then arise when subsequent exposure is sufficient to elicit a visible skin reaction (elicitation phase). As a consequence, predictive tests usually follow this pattern in which there is an induction phase, the response to which is measured by a standardized elicitation phase, typically involving a patch test. The local lymph node assay is the exception, directly measuring the induction response. Evidence of skin sensitization in humans normally is assessed by a diagnostic patch test.

(2) Classification criteria

A) Classification criteria based on Classification JIS

<Respiratory sensitization>

Classification JIS states that chemical substances shall be classified in respiratory sensitizer Category 1 in accordance with any one of the following criteria where data are not sufficient for sub-categorization,

a) if there is evidence in humans that the substance can lead to specific respiratory hypersensitivity and/or

b) if there are positive results from an appropriate animal test.

It also states “Where data are sufficient, chemical substances shall be allocated to sub-category 1A (strong respiratory sensitizers) or sub-category 1B for other respiratory
sensitizers”.

Sub-category 1A: Substances showing a high frequency of occurrence in humans; or a probability of occurrence of a high sensitization rate in humans based on animal or other tests\(^a\). Severity of reaction may also be considered.

Sub-category 1B: Substances showing a low to moderate frequency of occurrence in humans; or a probability of occurrence of a low to moderate sensitization rate in humans based on animal or other tests\(^a\). Severity of reaction may also be considered.

(Note) At present, recognized and validated animal models for the testing of respiratory hypersensitivity are not available. Under a certain circumstances, data from animal studies may provide valuable information in a weight of evidence assessment.

<Skin sensitization>

Classification JIS states that substances shall be classified in skin sensitizer Category 1 in accordance with any one of the following criteria where data are not sufficient for sub-categorization,

a) if there is evidence in humans that the substance can lead to sensitization by skin contact in a substantial number of persons, or

b) if there are positive results from an appropriate animal test.

It also states “Where data is sufficient, substances shall be allocated to sub-category 1A (strong skin sensitizers) or sub-category 1B for other skin sensitizers”.

Sub-category 1A: Substances showing a high frequency of occurrence in humans and/or a high potency in animals can be presumed to have the potential to produce significant sensitization in humans. Severity of reaction may also be considered.

Sub-category 1B: Substances showing a low to moderate frequency of occurrence in humans and/or a low to moderate potency in animals can be presumed to have the potential to produce sensitization in humans. Severity of reaction may also be considered.

B) Classification criteria in GHS (Reference information)

In classification criteria of Classification JIS and that of GHS, the same categories are adopted.

(3) Items on information sources and data

* Refer to "3-1-1 Sources of Information available” for classification procedure.

A) Data availability
• Classification is performed based on the weight of evidence for respiratory or skin sensitization. When considering the human evidence, it is necessary for a decision on classification to take into account the size of the population exposed and the extent of exposure.

• It is sometimes difficult to decide whether a substance is a respiratory/skin sensitizer or not in case it causes sensitization but shows an extremely low frequency of occurrence to the size of population exposed. It is necessary for a decision on classification to take into account the frequency of sensitization and intensity of the effects, and preferably to seek expert judgment.

• As for skin sensitization, if there is positive data from appropriate animal studies, sub-categorization of a skin sensitizer is possible based on the positive rate and exposure concentration in accordance with the relevant criteria.

• Judgment of “Not classified” should be made with caution, since even substances with no clear description of sensitizer in the information sources of this guidance may be sensitizing to human.

• (Reference information 1) The signal word used for skin sensitization Category 1 is “Warning”, while the word for respiratory sensitization Category 1 is “Danger”, since the latter is considered to produce more serious effects on human health.

• (Reference information 2) For sensitizers in general, the following information is helpful.
  -Frosch et al. Contact Dermatitis 4th Ed. Springer (413 substances)

• EU CLP (H334 and H317), EU DSD (R42, R43, and R42/43), Recommendation of Acceptable Concentration by the Japan Society for Occupational Health: respiratory tract sensitization and skin sensitization, TLV table of ACGIH: SEN or Sensitization substances, and Germany’s MAK list: Labeling of Sensitization substance (Sa, Sh, and Sah) can be referred to.

• OECD test guidelines include the following test methods relating to skin sensitization.
  OECD TG 406  Skin sensitization
  OECD TG 429  Skin sensitization: Local Lymph Node Assay (LLNA)
  OECD TG 442A  Skin sensitization: Local Lymph Node Assay (DA)
  OECD TG 442B  Skin sensitization: Local Lymph Node Assay (BrdU-ELISA)

B) Order of Precedence when Multiple Data Exist
Refer to “3-1-2 Order of Precedence when Multiple Data Exist”.

145
C) Comparison with conventional classification systems

- EU DSD classification categories relating to sensitization are R42, R43, and R42/43.
- The Recommendation of Acceptable Concentration of the Japan Society For Occupational Health includes the list of substances recognized as sensitizers. In the TLV table of ACGIH, SEN mark is assigned to sensitizers, and, in the MAK table of MAK (Germany), Sa • Sh • Sah marks are assigned.
- EU DSD classification R42 and R42/43, as well as respiratory tract sensitization in the Recommendation of Acceptable Concentration by the Japan Society for Occupational Health, correspond to respiratory sensitization Category 1. Particularly, occupational sensitizers to the airway Groups 1 and 2 classified by Japan Society for Occupational Health shall be dealt with as equivalent to Category 1A.
- EU DSD classification R43 and R42/43, as well as skin sensitization in the Recommendation of Acceptable Concentration of the Japan Society for Occupational Health, corresponds to skin sensitization Category 1. Particularly, skin sensitizer Groups 1 and 2 classified by Japan Society for Occupational Health shall be dealt with as equivalent to Category 1A.
- EU CLP classification H334 accords with respiratory sensitization Category 1, and H317 accords with skin sensitization Category 1.
- Whether SEN substances in ACGIH is respiratory sensitizers or skin sensitizers must be confirmed by reviewing the ACGIH Documentations.
- When necessary, classification criteria of exposure situation, the size of the population exposed, and the existence of sensitization should be examined by reviewing the quoted original literature.

D) Guidance concerning data

- Classification should be performed on the basis of any description concerning sensitization found in test reports, reviews, assessment documents, etc.

(4) Guidance for classification and judgment

A) Background of this item and points to be noted

Regarding the background of this item, refer to Part 1, Introduction. Also in classification, take the points below into account.

* Unless description that definitely denies hazards or recognizes extremely low hazards is available in List 1, determination of “Not classified” should be performed carefully. If there is any question, not “Not classified” but “Classification not possible,” which is based on the absence of sufficient information for judging, is preferable.
B) Classification procedures

1) Respiratory Sensitization:

Substances meeting [Decision Criteria 1] through [Decision Criteria 3] below shall be determined as belonging to Category 1.

[Decision Criteria 1]: In the cases where the substance is concluded to be positive in any assessment document in List 1 (“Is concluded” does not mean “is suggested” or “has the possibility”, but “is definitely stated (to be obviously positive).”).

(Exclusion Rule)

Even if the substance meets Decision Criteria 1, if it is proved that the substance induces asthma in only those who have bronchial hypersensitivity, the substance is determined as “Not classified”.

[Decision Criteria 2]: If there is evidence in humans that the substance can lead to specific respiratory hypersensitivity.

Regarding evidence in humans, refer to the UN GHS 4th revised edition 3.4.2.1.2.

Evidence refers to the following points.

【GHS 4th revised edition】 (3.4.2.1.2.3)

(a) clinical history and data from appropriate lung function tests related to exposure to the substance, confirmed by other supportive evidence which may include:

(i) in vivo immunological test (e.g. skin prick test);
(ii) in vitro immunological test (e.g. serological analysis);
(iii) studies that may indicate other specific hypersensitivity reactions where immunological mechanisms of action have not been proven, e.g. repeated low level irritation, pharmacologically mediated effects;
(iv) a chemical structure related to substances known to cause respiratory hypersensitivity;

(b) data from positive bronchial challenge tests with the substance conducted according to accepted guidelines for the determination of a specific hypersensitivity reaction.

[Decision Criteria 3]: If there are positive results from an appropriate animal test.

(At present, since recognized animal models for the testing of respiratory hypersensitivity are not available (the UN GHS 4th revised edition 3.4.2.1.3 footnote 2), [Decision Criteria 3] is not adopted in this guidance. When an appropriate animal model is set, this Decision Criteria will be adopted.)

2) Skin Sensitization:
Substances applicable to any of [Decision Criteria 1] through [Decision Criteria 4] below shall be determined as belonging to Category 1. In classification, take into account the UN GHS 4th revised edition 3.4.2.2.4. “Specific considerations”.

【GHS 4th revised edition】 (3.4.2.2.4)
3.4.2.2.4.1 For classification of a substance, evidence should include any or all of the following using a weight of evidence approach:
(a) Positive data from patch testing, normally obtained in more than one dermatology clinic;
(b) Epidemiological studies showing allergic contact dermatitis caused by the substance; Situations in which a high proportion of those exposed exhibit characteristic symptoms are to be looked at with special concern, even if the number of cases is small;
(c) Positive data from appropriate animal studies;
(d) Positive data from experimental studies in man (see Chapter 1.3, para. 1.3.2.4.7);
(e) Well documented episodes of allergic contact dermatitis, normally obtained in more than one dermatology clinic.
(f) Severity of reaction may also be considered.

[Decision Criteria 1]: In the case where the substance is concluded as positive in any assessment document in List 1.

[Decision Criteria 2]: In case it is concluded that the substance can lead to specific symptoms by skin contact in humans in any assessment document in List 1.

[Decision Criteria 3]: If there is an epidemiological study report showing allergic contact dermatitis caused by the substance, or if there are two or more care reports of allergic contact dermatitis from separate medical institutions, in List 1 or List 2.

[Decision Criteria 4]: If a positive result is obtained in the following animal tests.
○ Decision criteria for positive results (Classification into Category 1)
  When using adjuvant: 30% or more of animals react,
  When not using adjuvant: 15% or more of animals (guinea pig) react.
* The ratio of sensitized animal is often not clear. When the ratio is not clear, it is preferable to review the original literature and to examine the content and the ratio carefully. The same applies when skin sensitization based on the test is reported in List 1 and the ratio is not clear. In cases where the substance is
clearly concluded to include skin sensitization in List 1 based on the test, the substance is determined as belonging to Category 1. In all other cases, the substance shall be classified as “Classification not possible”.

* As for List 2, if an animal test was performed by the test method approved by OECD shown below, if the ratio of sensitized animal is clear, and in the cases where the substance is concluded as positive in skin sensitization, then the substance shall be classified in Category 1. In all other cases, the substance shall be classified as “Classification not possible” even if a test was carried out.

○ Criteria for sub-categorization
Allocate sub-category in accordance with the Tables 3-2-4-1 and 3-2-4-2 which include data with values based on animal test results.

<table>
<thead>
<tr>
<th>Assay</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local lymph node assay</td>
<td>EC3 value \leq 2%</td>
</tr>
<tr>
<td>Guinea pig maximization test</td>
<td>\geq 30% responding at \leq 0.1% intradermal induction dose or \geq 60% responding at &gt; 0.1% to \leq 1% intradermal induction dose</td>
</tr>
<tr>
<td>Buehler assay</td>
<td>\geq 15% responding at \leq 0.2% topical induction dose or \geq 60% responding at &gt; 0.2% to \leq 20% topical induction dose</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

○ Animal tests on skin sensitization approved by OECD
Positive data of animal test cannot be denied by the negative data of skin sensitization in humans. On the other hand, ambiguous positive data on human skin sensitization shall be categorized by referring to clear negative data of animal tests. (The concordance between human data and animal test data are reported in, 1) Magnusson B et. al. 1969: J Investigative Dermatol. 52, 268-276 2) Robinson MK et. al. 1990: Toxicology 61, 91-107 3) Schneider K and Akkan Z, 2004: Reg.
In above guinea pig tests, decision is made based on subjective evaluation for erythema and edema, while in LLNA method, incorporation of 3H-methylthymidine is indexed by T-cell formation induced during induction phase of allergic reaction. In LLNA method, Stimulation Index (SI value) of 3 or more is positive.

The above 3 animal testing methods are used for sub-categorization in 1A or 1B. However, LLNA: DA method (OECD TG442A) and BrdU-ELISA method (OECD TG442B), of which criteria for subcategorization has yet to be clearly defined, need to be used after careful decision.

The following skin sensitization test methods are not used for classification of the Japanese government because they are not approved by OECD.
3-2-5 Germ Cell Mutagenicity

(1) Definitions

Definitions of Germ Cell Mutagenicity in UN GHS are as follows.

【GHS 4th revised edition】 (3.5.1)

3.5.1.1 This hazard class is primarily concerned with chemicals that may cause mutations in the germ cells of humans that can be transmitted to the progeny. However, mutagenicity/genotoxicity tests in vitro and in mammalian somatic cells in vivo are also considered in classifying substances and mixtures within this hazard class.

3.5.1.2 In the present context, commonly found definitions of the terms “mutagenic”, “mutagen”, “mutations” and “genotoxic” are used. A mutation is defined as a permanent change in the amount or structure of the genetic material in a cell.

3.5.1.3 The term mutation applies both to heritable genetic changes that may be manifested at the phenotypic level and to the underlying DNA modifications when known (including, for example, specific base pair changes and chromosomal translocations). The term mutagenic and mutagen will be used for agents giving rise to an increased occurrence of mutations in populations of cells and/or organisms.

3.5.1.4 The more general terms genotoxic and genotoxicity apply to agents or processes which alter the structure, information content, or segregation of DNA, including those which cause DNA damage by interfering with normal replication processes, or which in a non-physiological manner (temporarily) alter its replication. Genotoxicity test results are usually taken as indicators for mutagenic effects.

Reference: Regarding a bacterial reverse mutation test (Ames test)

The Ames test is useful as a screening test for mutagens (especially, carcinogens), but its results alone cannot conclude "mutations in the germ cells of humans that can be transmitted to the progeny" - germ cell mutagenicity.

(2) Classification criteria

A) Classification criteria based on Classification JIS
Table 3-2-5-1: Hazard categories for Germ Cell mutagens

<table>
<thead>
<tr>
<th>Category 1: Chemical substances known to induce heritable mutations or to be regarded as if they induce heritable mutations in the germ cells present in humans.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category 1A:</strong> Chemical substances known to induce heritable mutations in germ cells present in humans.</td>
</tr>
<tr>
<td>Allocation of a chemical to Category 1A is based on positive evidence from human epidemiological studies.</td>
</tr>
<tr>
<td><strong>Category 1B:</strong> Chemical substances which should be regarded as if they induce heritable mutations in the germ cells of humans.</td>
</tr>
<tr>
<td>Allocation of a chemical substances to Category 1B is based on any of the following:</td>
</tr>
<tr>
<td>a) Positive result(s) from in vivo heritable germ cell mutagenicity tests in mammals; or</td>
</tr>
<tr>
<td>b) Positive result(s) from in vivo somatic germ cell mutagenicity tests in mammals, in combination with some evidence that the substance has potential to cause mutations to germ cells. This supporting evidence may, for example, be derived from mutagenicity/genotoxic tests in germ cells in vivo, or by demonstrating the ability of the substance or its metabolite(s) to interact with the genetic material of germ cells; or</td>
</tr>
<tr>
<td>c) Positive results from tests showing mutagenic effects in the germ cells of humans, without demonstration of transmission to progeny; for example, an increase in the frequency of aneuploidy in sperm cells of exposed humans.</td>
</tr>
</tbody>
</table>

Category 2: Chemical substances which cause concern for humans owing to the possibility that they may induce heritable mutations in the germ cells present in humans.

Allocation of a chemical to Category 2 is based on any of the following.

a) Somatic cell mutagenicity tests in vivo, in mammals; or

b) Other in vivo somatic cell genotoxicity tests which are supported by positive results from in vitro mutagenicity assays.

Note: Chemical substances which are positive in in vitro mammalian mutagenicity assays, and which also show chemical structure-activity relationship to known germ cell mutagens, should be considered for classification as Category 2 mutagens.

B) Classification criteria in GHS (Reference information)

In classification criteria of Classification JIS and those of GHS, the same categories are adopted.

(3) Items on information sources and data

*Regarding procedure of classification, refer to “3-1-1 Sources of information available for classification”*

A) Data availability

1) In the UN GHS 4th revised edition, “mutagenicity tests” and “genotoxicity tests” have
different meanings. The mutagenicity tests are tests indexed with gene mutation, structural and numerical abnormality of chromosome, and the genotoxicity tests are tests indexed with other elements, for example, DNA damage and DNA repairing. There exist extremely many kinds of mutagenicity tests and genotoxicity tests, and GHS shows examples of test methods that provide criteria for classification as heritable mutagens (Note) in humans. In table 3-2-5-2, in addition to GHS examples, several test methods are included to provide data that serve as the basis for classification.

(Note) The purport of GHS Categories is to take account of heritable mutagenicity effects in humans. In this guidance, to facilitate understanding, the term “heritable mutagenicity” is used in addition to “germ cell mutagenicity.” The “germ cell mutagenicity” means effects to induce mutagenicity/genotoxicity in germ cells, and “heritable mutagenicity” means effects to induce gene mutation chromosomal abnormality in future generation of the mutagenicity recognized in germ cells. In the UN GHS 4th revised edition, the term “heritable mutagenicity” is not used, but the corresponding phrase “to induce heritable mutations in germ cells of humans” is used.

2) The UN GHS 4th revised edition 3.5.5.1 “Decision logic 3.5.1 for substances” starts with the question, “Does the substance have data on mutagenicity?” The phrase “data on mutagenicity” here basically refers to data obtained from in vivo mutagenicity/genotoxicity test that are generally used and further refers to data including those obtained from in vitro tests. Expert’s support is required for making a decision on mutagenicity based on multiple conflicting test results.

3) For many chemicals, results from many mutagenicity tests (or genotoxicity tests) are reported including in vitro tests, but results from in vivo tests using mammalian germ cells are rare. Expert’s evaluation and decision are required for passing judgment on mutagenicity to human germ cells based on a large amount of in vitro and in vivo test reports.

4) Although human data are precious, usage of epidemiological data is extremely limited since, in many cases, data obtained from human monitoring exposed with some chemicals (for example, chromosome analysis on human peripheral lymphocytes) show unclear effects by the chemicals, and since the number of subjects is not sufficient to give a generalized conclusion. Epidemiological data may provide conflicting results, but they may be easily used when the validity of the finding (negative or positive) is recognized by assessment documents in List 1.
5) Chemicals having dataset from *in vivo* and *in vitro* tests are less in number than chemicals having *in vitro* test data only. In general, it is difficult to determine the existence of heritable mutagenicity based on results of *in vitro* tests only.

6) Results from rodent spermshape abnormality test shall not be used in this classification in principle since they may be affected by effects to other than genetic materials.

7) Data from various kinds of tests using drosophila (e.g. sex-linked or recessive lethal test, wing spot test, etc.) are not generally used in this classification since biological dynamics and reproduction development process are not the same between insects and mammals. However, where other appropriate mammalian *in vivo* mutagenicity/genotoxicity test data are not available, and there are positive results from drosophila sex-linked or recessive lethal test, expert judgment shall be sought for to see usability of the data and GHS classification category.

8) There exist many kinds of *in vitro* genotoxicity tests (Comet test in mammalian culture cells, UDS test in mammalian culture cells, DNA (Rec-assay) in Bacillus subtilis, umu test in Salmonella typhimurium, SOS test in Escherichia coli, chromatid aberration with aneuploid test in yeast, etc.) and Host-mediated assay, but results of these tests are, in principle, not used in this classification.

9) In *in vivo* mutagenicity/genotoxicity tests, various administration routes are used. Although the common human exposure routes take precedence, test data with any administration route may be utilized unless the inappropriateness of the route is rationally explained.

10) OECD test guidelines include the following test methods relating to mutagenicity/genotoxicity. Now, TGs 473, 474, 475, and 487 are being revised, whereas TGs 477, 479, 480, 481, 482, and 484 are to be deleted.
    - TG 471 Bacterial Reverse Mutation Test (Ames Test)
    - TG 473 In Vitro Mammalian Chromosome Aberration Test
    - TG 474 Mammalian Erythrocyte Micronucleus Test
    - TG 475 Mammalian Bone Marrow Chromosome Aberration Test
    - TG 476 In Vitro Mammalian Cell Gene Mutation Test
    - TG 477 Genetic Toxicology: Sex-linked Recessive Lethal Test in Drosophila melanogaster
TG 478 Genetic Toxicology: Rodent Dominant Lethal Test
TG 479 Genetic Toxicology: In Vitro Sister Chromatid Exchange Assay in Mammalian Cells
TG 480 Genetic Toxicology: Saccharomyces Cerevisiae Gene Mutation Assay
TG 481 Genetic Toxicology: Saccharomyces Cerevisiae Mitotic Recombination Assay
TG 482 Genetic Toxicology: DNA Damage and Repair, Unscheduled DNA Synthesis in Mammalian Cells In Vitro
TG 483 Mammalian Spermatogonial Chromosome Aberration Test
TG 484 Genetic Toxicology: Mouse Spot Test
TG 485 Genetic Toxicology: Mouse Heritable Translocation Assay
TG 486 Unscheduled DNA Synthesis (UDS) Test with Mouse Liver Cells In Vitro
TG 487 In Vitro Mammalian Cell Micronucleus Test
TG 488 Transgenic Rodent Somatic and Germ Cell Gene Mutation Assays

Regarding the above mutagenicity tests, the following information source is helpful.

National Institute of Health Sciences, Division of Genetics and Mutagenesis
“5. Genotoxicity tests” in “Explanation of terms” (Japanese)
http://dgm2alpha.nih.go.jp/other%20files/genotoxicity%20(09.1.4).html
### Table 3-2-5-2: Test data as the basis of GHS classification (*: added to the examples in the GHS)

(1) An example of test data showing mutagenic effects in the germ cells present in humans, without demonstration of transmission to progeny

- Analysis of aneuploidy in sperm cells of exposed people

(2) Examples of *in vivo* heritable germ cell mutagenicity tests in mammals are:

- Rodent dominant lethal test (OECD Test Guideline 478)
- Mouse heritable translocation assay (OECD Test Guideline 485)
- Mouse specific locus test

(3) Examples of *in vivo* somatic cell mutagenicity tests in mammals are:

- Mammalian bone marrow chromosome aberration test (OECD Test Guideline 475)
- Mouse spot test (OECD Test Guideline 484)
- Mammalian erythrocyte micronucleus test (OECD Test Guideline 474)
- *Metaphase or micronucleus formation analysis of peripheral lymphocytes of exposed people (Human monitoring)*
- Mammalian peripheral lymphocytes chromosome aberration test
- *Gene mutation tests with transgenic animal models in somatic cells (OECD 488)*

(4) Examples of *in vivo* mutagenicity tests in germ cells present in mammals are:

- Mammalian spermatogonial chromosomal aberration test (OECD Test Guideline 483)
- Spermatid micronucleus assay
- Gene mutation tests with transgenic animal models in germ cells* (OECD Test Guideline 488)

(5) Examples of *in vivo* genotoxicity tests in germ cell in mammals are:

- Sister chromatid exchange (SCE) analysis in spermatogonia
- Unscheduled DNA synthesis (UDS) test in testicular cells
- Assays of (covalent) binding or adduct formation to germ cell DNA*
- Assays of DNA damage in germ cells (comet assay, alkaline elution assay, etc.)*

(6) Examples of *in vivo* genotoxicity tests in somatic cells in mammals are:

- Liver UDS test (OECD Test Guideline 486)
- Bone marrow or peripheral lymphocytes SCE analysis
- Assays of (covalent) binding or adduct formation to somatic cell DNA*
- Assays of DNA damage in somatic cells (comet assay, alkaline elution assay, etc.)*
Examples of *in vitro* mutagenicity tests:

- *In vitro* mammalian cell chromosome aberration test (OECD Test Guideline 473)
- *In vitro* mammalian cell micronucleus test* (OECD Test Guideline 487)
- *In vitro* mammalian cell gene mutation test (OECD Test Guideline 476)
- Bacterial reverse mutation tests (OECD Test Guideline 471)

Reference: In addition to the above test methods, there are other test methods as follows. In principle, these test methods are not required to be used in classification. When using these test methods, it is preferable to seek for an expert judgment.

- Sperm abnormality test using rodents (See A 6)
- Several drosophila tests sex-linked recessive lethal test, wing spot test, etc. (See A 7)
- *In vitro* genotoxicity tests (See A 8)
  - comet assay
  - UDS test using mammalian cultured cells
  - DNA repair test (Rec-assay) in bacteria
  - umu test or SOS test using bacteria
  - aneuploidy test using yeast, etc.
- host-mediated assay in bacterial gene mutation test(See A 8)

B) Order of precedence when multiple data exist

By referring to “3-1-2 Order of precedence when multiple data exist”, basically the following data are adopted with precedence. All of appropriate data, however, should be utilized, and classification should be performed based on the overall weight of evidence.

1) Classification should be based on tests which were conducted appropriately and validated sufficiently. For example, tests conducted according to internationally recognized test methods such as OECD test guidelines and GLP satisfy this condition.

2) Data concerning mutagenicity tests are abundant, but such data are assigned greater weight of evidence that are more likely to lead to a judgment that a tested substance has the potential to induce heritable mutations in human germ cells (*in vivo* tests using germ cells rather than somatic cells, *in vivo* tests rather than *in vitro* tests, *in vitro* tests using human cultured cells rather than mammalian cultured cells).

3) As can be seen from the classification criteria described in the UN GHS 4th revised edition, generally, classification in Category 2 is not based only on positive results from *in vitro* mutagenicity tests. An attention needs to be paid also to results from *in vivo* mutagenicity tests in drosophila. Some test reports may contain multiple negative or positive results, and the classification based on a part of positive results alone is required to be verified of its validity.
C) Comparison with conventional classification systems

- The concept of GHS DSD classification for Germ Cell Mutagenicity is fundamentally in accord with that for Mutagen Categories 1, 2, and 3 in EU DSD classification.
- Mutagens classified as Category 1 (R46) in EU classification correspond to substances in Category 1A. (To date, no such substance has been identified.)
- Mutagens classified as Category 2 (R46) in EU DSD classification correspond to substances in Category 1B.
- Mutagens classified as Category 3 (R68) in EU DSD classification correspond to substances in Category 2.
- EU CLP classification H340 accords with Category 1B, and H341 accords with Category 2.

D) Guidance concerning data

Classification should be performed based on data derived from appropriate information sources. (Germ cell) Mutagenicity classification established by EU and classification of German MAK Committee are helpful.

The mutagenicity in EU classification and the germ cell mutagenicity in GHS have the same objective and classification criteria. Accordingly, test methods which can be used in EU classification can also be used in GHS classification. Other test methods, if appropriate, can also be used.

(4) Guidance for classification and judgment

A) Background of this item and points to be noted

Refer to Part 1, Introduction for the background of this item.

In classification, compare and examine all available data. It is preferable to seek for an expert's judgment about the evaluation of test results as needed. Substances having only in vitro mutagenicity data available shall, generally, be classified in "Classification not possible".

* Refer to the UN GHS 4th revised edition for germ cell mutagenicity and this item, and classify substances according to Figure 3.5.1 Hazard categories for germ cell mutagens in the UN GHS 4th revised edition.

* The workflow, “Classification of Germ Cell Mutagenicity (Figure3-2-5-1) in this guidance, which is based on the information in UN GHS 4th revised edition, Figure 3.5.1, shows one of the classification procedures which take into account the weight of evidence. In the classification workflow, factors such as quality of the data are taken into account. Data related to human in the UN GHS 4th revised edition are included as “examples of in vivo mutagenicity tests in germ cell in mammals” which is shown in Table 3-2-5-2.
B) Classification Criteria

Shown below are examples of test results corresponding to each GHS Category and the classification workflow in Figure 3-2-5-1 for helping classification. In the workflow, positive results fundamentally take precedence, but their appropriateness may be examined when needed. “Negative” results may be the result of using only one of many indexes (for example, using a part of strains in bacterial reverse mutation tests) or the result of tests conducted inappropriately (for example, inappropriate sampling time in bone marrow micronucleus test), and examination of their validity should be performed when needed. On the whole, the validity of each set of data is considered, and the substance is determined based on the weight of evidence.

1) Category 1A: When positive evidence from epidemiological studies in human germ cells is available

Substances known to induce heritable mutations in germ cells present in humans through information of human epidemiological studies shall be classified in Category 1A. It should be noted that no such substance has been identified to date.

2) Category 1B: When in vivo mutagenicity test data and information suggesting germ cell mutagenicity are available:

Substances which should be regarded as if they induce heritable mutation in humans shall be classified in Category 1B when positive result(s) are obtained from many tests including in vivo mutagenicity tests in germ cells present in mammals. Specifically, the following cases are applicable:

a) Positive results from tests showing mutagenic effects in the germ cells present in humans, without demonstration of transmission to progeny; for example, an increase in the frequency of aneuploidy in sperm cells of exposed humans.

b) Positive result(s) from in vivo heritable germ cell mutagenicity tests in mammals (e.g. Rodent dominant lethal test, Mouse heritable translocation assay, Mouse specific locus test, etc.)

c) Positive result(s) from in vivo somatic cell mutagenicity tests in mammals (e.g. mammalian bone marrow chromosome aberration test, mouse spot test, mammalian erythrocyte micronucleus test) in combination with some evidence that the substance has potential to cause mutations to germ cells present in mammals; for example, positive result(s) from in vivo mutagenicity tests in germ cells present in mammals (e.g. mammalian spermatogonial chromosomal aberration test, spermatid micronucleus assay), or in vivo genotoxicity tests in germ cells (e.g. sister chromosome exchange (SCE) analysis in mammalian spermatogonia, unscheduled DNA synthesis (UDS) test in
mammalian testicular cells, etc.) and evidence of exposure of germ cells to the substance or its metabolite(s).

3) Category 2: When *in vivo* mutagenicity/genotoxicity test data are available, but when no direct information suggesting mutation of germ cells is available:

Substances which cause concern for humans owing to the possibility that they may induce heritable mutagenicity in humans shall be classified in Category 2. For example, the following cases apply:

a) Positive result(s) obtained from *in vivo* somatic cell mutagenicity tests in mammals (e.g. mammalian bone marrow chromosome aberration test, mouse spot test, mammalian erythrocyte micronucleus test), but no data is available to show that the substance should be regarded as if they induce mutagenicity in germ cells present in mammals

b) Positive results from *in vivo* genotoxicity tests in mammalian somatic cells (unscheduled DNA synthesis (UDS) test in mammalian liver, sister chromosome exchange (SCE) test analysis in mammalian bone marrow, etc.) and positive results from *in vitro* mutagenicity tests (chromosomal abnormality test in mammalian cultured cells, gene mutation test in mammalian cultured cells, bacterial reverse mutation test, etc.). It should be noted that expert judgment should be used for classification on an as needed basis.

c) Positive results from *in vitro* mutagenicity tests in mammalian cultured cells and from bacterial reverse mutation test, or structure activity relationship to known germ cell mutagens (Category 1, that is heritable mutagens) even in the absence of *in vivo* test data. It should be noted that expert judgment should be used for classification. By the way, the sentence in UN GHS, “Substances which are positive in in vitro mammalian mutagenicity assays, and which also show structure activity relationship to known germ cell mutagens” is interpreted as “positive results in Ames test (presumption from structure activity relationship is acceptable) as well as positive results in mammalian *in vitro* mutagenicity tests” (in most cases, chromosome aberration test or mouse lymphoma assay). In case a substance is positive in 2 kinds of mutagenicity tests including mammalian *in vitro* test, which includes presumption from structure activity relationship, expert judgment shall be used.

4) Classification not possible

In case any of the above 1) through 3) does not apply: this includes the cases that no data on mutagenicity tests are obtained or that no test data with positive results are obtained.

Substances which were classified as “not classified” in accordance with GHS Classification Guidance for the Japanese Government revised in 2010 can be classified as “Classification not possible”.

160
Figure 3-2-5-1: Classification workflow of Germ Cell Mutagenicity
(Proposed in Revision 1.5)

Is there positive evidence from human epidemiological studies that the substance induce heritable mutations?
- Yes: Category 1A
- No: Category 1B

Are there positive results from tests showing mutagenic effects in the germ cells of humans, without demonstration of transmission to progeny? (1)
- Yes: Category 1B
- No: Category 1B

Are there positive results from in vivo heritable germ cell mutagenicity test (2) in mammals?
- Yes: Category 1B
- No: Category 2

Are there positive results from in vivo heritable germ cell mutagenicity test (2) in mammals? (Note 1)

Are there positive results from in vivo somatic cell mutagenicity test (3) in mammals? (Note 1)

Are there positive results from in vivo somatic cell genotoxicity test (6) in mammals? (Note 2)
- Yes: Category 2
- No: Classification not possible

Are there positive results from in vitro mutagenicity test? (7)
- Yes: Category 2
- No: Classification not possible

Are there positive data from the in vitro mutagenicity test (7)? (Note 3)

Expert judgment is used taking into account the positive results from bacterial reverse mutation test or information such as structure activity relationship to known germ cell mutagens.

: Yes  : No

(Note 1) Positive results from appropriately performed/evaluated in vivo germ cell mutagenicity tests (4) shall be treated similarly.

(Note 2) Positive results from appropriately performed/evaluated in vivo genotoxicity tests (5) shall be treated similarly.

(Note 3) Expert judgment shall be used for decision of classification as needed basis.
3-2-6 Carcinogenicity

(1) Definitions

Definitions of Carcinogenicity in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】 (3.6.1)

The term *carcinogen* denotes a substance or a mixture of chemical substances which induce cancer or increase its incidence. Substances and mixtures which have induced benign and malignant tumors in well performed experimental studies on animals are considered also to be presumed or suspected human carcinogens unless there is strong evidence that the mechanism of tumor formation is not relevant for humans.

Classification of a substance or mixture as posing a carcinogenic hazard is based on the inherent properties of the substance and does not provide information on the level of the human cancer risk which the use of the substance or mixture may represent.

(2) Classification criteria

A) Classification criteria based on Classification JIS

Hazard categories for carcinogens in Classification JIS are shown below.

<table>
<thead>
<tr>
<th>Table 3-2-6-1: Hazard categories for carcinogens</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category 1:</strong> Known or presumed human carcinogens</td>
</tr>
<tr>
<td>The placing of a substance in Category 1 is done on the basis of epidemiological and/or animal data. An individual chemical may be further distinguished:</td>
</tr>
<tr>
<td>Category 1A: Known to have carcinogenic potential for humans; the placing of a chemical is largely based on human evidence.</td>
</tr>
<tr>
<td>Category 1B: Presumed to have carcinogenic potential for humans; the placing of a chemical is largely based on animal evidence.</td>
</tr>
<tr>
<td>Based on strength of evidence and additional considerations (weight of evidence), such evidence may be derived from human studies that establish a causal relationship between human exposure to a chemical and the development of cancer (known human carcinogen). Alternatively, evidence may be derived from animal experiments for which there is sufficient evidence to demonstrate animal carcinogenicity (presumed human carcinogen). In addition, on a case by case basis, scientific judgment may warrant a decision of presumed human carcinogenicity derived from studies showing limited evidence of carcinogenicity in humans together with limited evidence of carcinogenicity in experimental animals.</td>
</tr>
<tr>
<td>Classification: Carcinogen Category 1A and Carcinogen Category 1B</td>
</tr>
</tbody>
</table>
Category 2: Suspected human carcinogens

The placing of a chemical in Category 2 is done on the basis of evidence obtained from human and/or animal studies, but which is not sufficiently convincing to place the chemical in Category 1. Based on strength of evidence together with additional considerations, such evidence may be from either limited evidence of carcinogenicity in human studies or from limited evidence of carcinogenicity in animal studies.

Classification: Carcinogen Category 2 Carcinogen

B) Classification criteria in GHS (Reference information)

In classification criteria of Classification JIS and that of GHS, the same categories are adopted.

(3) Items on information sources and data

* Classification procedure can be referred to "3-1-1 Sources of Information available for classification".

A) Data availability

- Many descriptions on carcinogenicity can be found in hazard-related reviews and databases. Useful rankings of carcinogenicity are reported by many organizations, which can be of reference in classification (WHO International Agency for Research on Cancer (IARC), Classification results of EU classification, the U.S. National Toxicology Program(NTP), carcinogens in “Recommendations for Acceptable Concentrations” by the Japan Society For Occupational Health, Carcinogenicity notes in “TLVs and BEIs” by ACGIH, Integrated Risk Information System(IRIS) by the U.S. EPA, Carcinogenicity notes in “List of MAK and BAT Values” by Germany DFG, etc. See [3-1]).

- OECD Test Guidelines include the following test methods relating to Carcinogenicity.
  
  OECD TG 451  Carcinogenicity studies
  OECD TG 453  Combined chronic toxicity / carcinogenicity studies

B) Order of Precedence when Multiple Data Exist

By referring to “3-1-2 Order of Precedence when Multiple Data Exist”, the following points should be taken into consideration.

Information by IARC and EU represents conclusions led by many experts, and considered preferentially in principle. Besides, information by the Japan Society for Occupational Health, US-EPA, US-NTP, ACGIH, and the Germany DFG, if any, can be of reference. It should be noted that it is necessary to take into account the year of publication of each organization.

C) Comparison with conventional classification systems
• The principles of GHS classification for Carcinogenicity generally accords with those of the IARC Carcinogenicity group classification and the Carcinogenicity category classification of EU classification.
• If a conventional classification system is to be used, it should correspond to GHS categories as follows.

Table 3-2-6-2: Correspondence table between GHS classification and classifications by other organizations (Carcinogenicity)

* When Carcinogenicity classification is performed according to the above table, data need not to be input into other items such as toxicity information or epidemiological/occupational exposure. When EU classification alone is available, however, toxicity information is needed.

(Note 1) Since EU classification does not provide the basic hazard information for its classification decisions, review other information sources and confirm their validity.

If EU classification alone is available, classify the substance as “Classification not possible”.

(Note 2) Note that the abbreviations of EPA classification change from year to year.

Abbreviations in the 1986 Guideline:

A: Human carcinogen
B1: Probably human carcinogen (Limited human evidence of carcinogenicity in human)
B2: Probably human carcinogen (sufficient animal evidence, but inadequate human evidence for carcinogenicity)
C: Possible human carcinogen (human data are inadequate and animal data demonstrate limited evidence of carcinogenicity)
D: Not classifiable as to human carcinogenicity
E: Evidence of Non-carcinogenicity for human

Abbreviations in the 1996 Guideline (tentative) are as follows:

K: Known human carcinogens
L: Likely to produce cancer in humans
CBD: Cannot be determined
NL: Not likely to be carcinogenic in humans
Abbreviations in the 2005 Guideline are as follows:
CaH: Carcinogenic to humans
L: Likely to be carcinogenic to humans
S: Suggestive evidence of carcinogenic potential
I: Inadequate information to assess carcinogenic potential
NL: Not likely to be carcinogenic to humans

Abbreviations in the Japan Society for Occupational Health classification are as follows:
Group 1: carcinogenic to humans
Group 2A: probably carcinogenic to humans
Group 2B: possibly carcinogenic to humans

Abbreviations in the ACGIH classification are as follows:
A1: Confirmed human carcinogen
A2: Suspected human carcinogen
A3: Confirmed animal carcinogen with unknown relevance to humans
A4: Not classifiable as a human carcinogen
A5: Not suspected as a human carcinogen

Abbreviations in the National Toxicology Program (NTP) classification are as follows:
K: Known
R: Reasonably suspected

D) Guidance related to data
For classification based on carcinogenicity test data, substances known to be carcinogens for humans shall be classified in Category 1A. Substances presumed to be carcinogens for humans largely based on animal evidence shall be classified in Category 1B. Other substances suspected to be human carcinogens shall be classified in Category 2.

(4) Guidance for classification and judgment
A) Background of this item and points to be noted
As for background of this item, refer to Part 1, Introduction.
In classification, take the following points into account.
* Regarding all assessment documents in List 1, be sure to search a description relating to the substance.
* If required information for GHS classification of a given substance is not available, do not try to classify it in a Procrustean fashion but classify it in “Classification not possible”.
* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, the determination of “Not classified” should be performed carefully. If there is any question, a given substance should rather be classified in “Classification not possible” due to insufficient information for judgment.

B) Substance for which GHS classification is possible without expert's judgment

For substances classified in accordance with the following procedures, the GHS classification can be adopted without an expert's judgment.

1) GHS classification of substances which have been already evaluated by the following organizations shall be performed in accordance with Table 3-2-6-2 Correspondence table of GHS classification and classifications of other organizations (Carcinogenicity). The evaluation results of IARC take precedence. If multiple assessment documents classified a substance in different categories, the substance is classified in accordance with the latest document in principle. If the latest documents (for example, EPA and NTP) classified the substance in different categories and if GHS classification is not possible, classification shall be properly carried out by referring to previous assessment documents (expert judgment shall be used on an as needed basis).

(Example) If a substance is classified in K/L by the EPA classification (1996), and in 2A by the IARC classification (1997), the substance shall be classified in Category 1B by GHS classification.

* International Agency for Research on Cancer: IARC
* Japan Society For Occupational Health
* American conference of Governmental Industrial Hygienists: ACGIH
* Environmental Protection Agency: EPA (The Guideline draft (1996) and the Guideline (2005) do not use numbers/letters in classification. Therefore, in this guidance, the following abbreviations are used for the sake of convenience.)

2) When a substance is definitely determined to be classified in “Classification not possible” due to the absence of relevant information in “Table 3-2-6-2 Correspondence table of GHS classification and classifications of other organizations (Carcinogenicity)” and insufficiency of other hazard information, it should be classified as such.

3) Data are not available → “Classification not possible”, positive data are not available (only negative data are available) for a substance → the substance shall be classified in “Not
classified” if there is no problem based on an expert's judgment

4) If EU classification together with its evidence information is not available, the substance shall be classified in “Classification not possible”. If EU classification together with its evidence information is not available but if the criteria for EU classification are different from those for GHS classification, EU classification may be utilized in GHS classification provided that the information on which the former is based is scientifically appropriate. If EU classification together with its evidence information is not available and the criteria for EU classification are the same as those for GHS classification, GHS classification may be performed according to EU classification.

C) Descriptions requiring an expert's judgment

B) As for substances whose classification it is difficult to or impossible to determine in accordance with B) 1) and B) 2) above and those for which human carcinogenicity is strongly presumed to be impossible due to species difference and other factors as the result of a proof or estimation of the mechanism of animal carcinogenicity, all the descriptions regarding carcinogenicity cited in the assessment documents shall be collected and an expert's judgment shall be sought for, as follows.

1) Descriptions relating to Carcinogenicity, or descriptions suggesting Carcinogenicity in List 1 (except for assessment documents shown in B) 1))

2) Descriptions shown below in List 2 and List 3. This prescription shall not prohibit persons responsible for classification from presenting the documents and descriptions which they judged to be considered in the template.

- Descriptions given in a section clearly intended for “carcinogenicity”
- Descriptions which confirmed the occurrence of tumor(s) after conducting histopathological inspection in a long-term administration test with animals (or descriptions clearly referring to the presence or absence of or suggestion of carcinogenicity or tumor)
- Epidemiological studies in human groups

D) Substances especially requiring an expert's judgment

1) The following substances are generally classified as carcinogens and need careful examination. Since some substances induce cancer inherent to animals (with species difference) through the mechanism different from that of humans, such as the different metabolic system, a cautious investigation should be conducted for the judgment based on these categories.
   a) Aromatic hydrocarbons
   b) Aromatic amines
c) N—nitroso compounds
d) Quinoline-derivatives
e) Nitrosofuran-derivatives
f) Azo compounds
g) Haloethers and other active halogenides
h) Metals (arsenic, cadmium, chromium, nickel, etc.)

(Reference: “Toxicology”, edited by the Japanese Society of Toxicology, Educational committee, p.143-156 Asakura Shoten (2004))

2) In extrapolation from animals to humans, it is known that the following instances of carcinogenicity may be denied as human carcinogenicity depending on the species difference described above. The denial of carcinogenicity below requires expert's decision.

a) Kidney Carcinogenicity in rat induced by renal tubular over accumulation of α2u-globulin
b) Rodent liver Carcinogenicity proved to be similar with the carcinogenic mechanism of phenobarbital
c) Rat thyroid bland Carcinogenicity derived from metabolic stimulation activity of thyroid hormones in liver
d) Rat testis Carcinogenicity through dopaminergic hypothalamic stimulation
e) Bladder Carcinogenicity induced by physical stimulation to urinary bladder mucosa by urine metabolites
3-2-7 Reproductive Toxicity

(1) Definitions

Definitions of Reproductive Toxicity in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(3.7.1)

3.7.1.1 Reproductive toxicity

Reproductive toxicity includes adverse effects on sexual function and fertility in adult males and females, as well as developmental toxicity in the offspring. The definitions presented below are adapted from those agreed as working definitions in IPCS/EHC Document N° 225 Principles for evaluation health risks to reproduction associated with exposure to chemicals. For classification purposes, the known induction of genetically based inheritable effects in the offspring is addressed in Germ cell mutagenicity (Chapter 3.5), since in the present classification system it is considered more appropriate to address such effects under the separate hazard class of germ-cell mutagenicity.

In this classification system, reproductive toxicity is subdivided under two main headings:

(a) Adverse effects on sexual function and fertility;

(b) Adverse effects on development of the offspring.

Some reproductive toxic effects cannot be clearly assigned to either impairment of sexual function and fertility or to developmental toxicity. Nonetheless, chemicals with these effects would be classified as reproductive toxicants with a general hazard statement.

3.7.1.2 Adverse effects on sexual function and fertility

Any effect of chemicals that would interfere with sexual function and fertility. This may include, but not be limited to, alterations to the female and male reproductive system, adverse effects on onset of puberty, gamete production and transport, reproductive cycle normality, sexual behavior, fertility, parturition, pregnancy outcomes, premature reproductive senescence, or modifications in other functions that are dependent on the integrity of the reproductive systems.

Adverse effects on or via lactation are also included in reproductive toxicity, but for classification purposes, such effects are treated separately (see 3.7.2.1). This is because it is desirable to be able to classify chemicals specifically for an adverse effect on lactation so that a specific hazard warning about this effect can be provided for lactating mothers.

3.7.1.3 Adverse effects on development of the offspring

Taken in its widest sense, developmental toxicity includes any effect which interferes with normal development of the conceptus, either before or after birth, and resulting from exposure of either parent prior to conception, or exposure of the developing offspring during prenatal development, or postnatally, to the time of sexual maturation. However, it is considered that
classification under the heading of developmental toxicity is primarily intended to provide a
hazard warning for pregnant women and men and women of reproductive capacity. Therefore, for
pragmatic purposes of classification, developmental toxicity essentially means adverse effects
induced during pregnancy, or as a result of parental exposure. These effects can be manifested at
any point in the life span of the organism. The major manifestations of developmental toxicity
include death of the developing organism, structural abnormality, altered growth and functional
deficiency.

(2) Classification criteria
   A) Classification criteria based on Classification JIS

   Hazard categories of Reproductive toxicants and effects on lactation in Classification JIS
   are presented below.

   **Table 3-2-7-1: Hazard categories for Reproductive toxicants**

<table>
<thead>
<tr>
<th>Category 1:</th>
<th>Known or presumed human reproductive toxicant</th>
</tr>
</thead>
</table>
|            | This category includes substances which are known to have produced an adverse effect on sexual
|            | function and fertility or on development in humans or for which there is evidence from animal
|            | studies, possibly supplemented with other information, to provide a strong presumption that the
|            | substance has the capacity to interfere with reproduction in humans. For regulatory purposes, a
|            | substance can be further distinguished on the basis of whether the evidence for classification is
|            | primarily from human data (Category 1A) or from animal data (Category 1B). |

   Category 1A: Known human reproductive toxicant

   The placing of the substance in this category is largely based on evidence from humans.

   Category 1B: presumed human reproductive toxicant

   The placing of the substance in this category is largely based on evidence from experimental
   animals. Data from animal studies should provide clear evidence of an adverse effect on sexual
   function and fertility or on development in the absence of other toxic effects, or if occurring
   together with other toxic effects the adverse effect on reproduction is considered not to be a
   secondary non-specific consequence of other toxic effects. However, when there is mechanistic
   information that raises doubt about the relevance of the effect for humans, classification in
   Category 2 may be more appropriate.

   Category 2: Suspected human reproductive toxicant

   This category includes substances

   a) for which there is some evidence from humans or experimental animals, positively supplemented
with other information, of an adverse effect on sexual function and fertility, or on development, in the absence of other toxic effects, or
b) if occurring together with other toxic effects the adverse effect on reproduction is considered not to be a secondary non-specific consequence of the other toxic effects, and where the evidence is not sufficiently convincing to place the substance in Category 1 (for instance, deficiencies in the study may make the quality of evidence less convincing, and in view of this Category 2 could be the more appropriate classification).

<table>
<thead>
<tr>
<th>Table 3-2-7-2: Hazard categories for effects on or via lactation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Effects on or via lactation</strong></td>
</tr>
<tr>
<td>Effects on or via lactation are allocated to this separate single category. Not many substances have information on the potential to cause adverse effects to offspring via lactation. However, substances which are absorbed by women and have been shown to interfere with lactation, or which may be present (including metabolites) in breast milk in amounts sufficient to cause concern for the health of a breastfed child, should be classified to indicate this property hazardous to breastfed babies. This classification can be assigned on the basis of any of the following:</td>
</tr>
<tr>
<td>a) absorption, metabolism, distribution, and excretion studies that would indicate the likelihood the chemical would be present in potentially toxic levels in breast milk,</td>
</tr>
<tr>
<td>b) results of one or two generation studies in animals which provide clear evidence of adverse effect in offspring due to transfer in breast milk or adverse effect on the quality of the breast milk,</td>
</tr>
<tr>
<td>c) human evidence indicating a hazard to babies during the lactation period.</td>
</tr>
</tbody>
</table>

B) Classification criteria in GHS (Reference information)

In classification criteria of Classification JIS and that of GHS, the same categories are adopted.

(3) Items on information sources and data

* Classification procedure can be referred to "3-1-1 Sources of Information available for classification".

A) Data availability

- Assessment concerning reproductive toxicity has been reported in SIDS, EHC, or ECETOC.
- A large amount of data is available from reports on reproductive toxicity, but experts must check their original literature to see if they meet the requisite criteria.
- OECD Test Guidelines include the following test methods relating to Reproductive Toxicity.
OECD TG 414  Prenatal development toxicity study  
OECD TG 415  One-generation reproduction toxicity study  
OECD TG 416  Two-generation reproduction toxicity  
OECD TG 421  Reproduction / developmental toxicity screening test  
OECD TG 422  Combined repeated dose toxicity study with the reproduction / developmental toxicity screening test

B) Order of Precedence when Multiple Data Exist  
Refer to “3-1-2 Order of Precedence when Multiple Data Exist”.  
If appropriate information sources based on data cannot be obtained easily, try to obtain the original EU assessment documents from the EU DSD classification (R60, R61, R62, R63, or R64) corresponding to reproductive toxicity. When the assessment documents are obtained, classify on the basis of the documents.

C) Comparison with conventional classification systems  
- The concept of the EU category classification on reproductive toxicity corresponds to that of the GHS category classification.  
- Substances classified as CLP: Repr. 1A, H360 and EU DSD Category 1, R60 and R61 correspond to GHS Category 1A.  
- Substances classified as CLP: Repr. 1B, H360 and EU DSD Category 2, R60 and R61 correspond to GHS Category 1B.  
- Substances classified as CLP: Repr. 2, H361 and EU DSD Category 3, R62 and R63 correspond to GHS Category 2.  
- Since substances assigned EU CLP Lact.-H362 and EU DSD R64 are applicable to “the additional category for effects on or via lactation”, the hazard statement “May cause harm to breast-fed children” shall be applied.

D) Guidance concerning data  
When classification is performed based on reproductive toxicity test data, substances known to have reproductive toxicity to humans are classified in Category 1A. Substances presumed to have reproductive toxicity to humans largely based on evidence from experimental animals are classified in Category 1B. Other substances suspected of reproductive toxicity to humans are classified in Category 2.

(4)Guidance for classification and judgment  
A) Background of this item and points to be noted  
As for background of this item, refer to Part 1, Introduction.
In classification, take the following points into account.

* Regarding all assessment documents in List 1, be sure to search a description relating to the substance.

* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, the determination of “Not classified” should be performed carefully. If there is any question, a given substance should rather be classified in “Classification not possible” due to insufficient information for judgment.

B) Key points for classification

- Taking into account that when there is any difference between tested animal and humans regarding administration methods or action mechanisms, the results of the animal tests lose their weight as evidence. For example, if the action mechanism of a substance is different in humans and tested animals and if it is clearly proved that the hazard caused by the substance is not manifested in humans, then the substance should not be classified in this category, even if reproductive toxicities are manifested in the tested animals.

- When a test material indicates toxicity in the bodies of mothers among the tested animal, the test material can sometimes be observed as if it indicated reproductive toxicity. Accordingly, when evidence of reproductive toxicity is secondary non-specific effects caused by other toxic actions, the evidence should not be used for classification. The same shall apply for embryos and fetuses.

C) General considerations

1) Reproductive Toxicity

   GHS defines reproductive toxicity as toxic effects on sexual function and fertility in adult males and females, as well as on development of offspring.

2) Adverse effects on sexual function and fertility

   Any effect by chemicals that could interfere with sexual function and fertility. This includes alterations to the female and male reproductive organs, adverse effects on onset of puberty, gamete reproduction and transport, reproductive cycle normality, sexual behavior, fertility, parturition, or pregnancy outcomes, premature reproductive senescence, or modifications in other normal reproductive functions.

3) Adverse effects on development of the offspring

   In its widest sense, developmental toxicity includes any effects which interfere with normal development of the conceptus, fetus, and born children. However, for the purpose of classification, the developmental toxicity is limited to adverse effects essentially induced during pregnancy or as a result of parental exposure.
D) Decision logic and classification of substances

1) Decision logic for substances

Decision is performed according to the UN GHS 4th revised edition 3.7.5.1 Decision logic for reproductive toxicity. The possibility that the toxicity for dam animals may be secondary result should be examined sufficiently. (For example, see the UN GHS 4th revised edition 3.7.2.4)

2) Classification

In principle, information shall be collected according to this guidance, and substances shall be classified in accordance with the collected data.

[Substance to be determined as “Classification not possible”]

A substance is determined to be placed in “Classification not possible” when no data on reproductive toxicity of the substance is available.

[Substance to be classified as]:

Category 1A : Substances known to have adverse effect on human sexual functions, fertility, or development of offspring

(Decision criteria)

A substance which is clearly described as recognized to have reproductive toxicity in humans in information of List 1.

* When other substances are considered to fall under Category 1A, expert judgment shall be used.

* In case a substance falls under “3) d) Substance requiring caution in classification” given later and information enough to prove that the substance falls under Category 1A is not obtained as a result of literature survey based on this classification guidance, expert judgment shall be used.

Category 1B : Substance presumed to have adverse effect on human sexual functions, fertility, or development of offspring

(Decision criteria)

Substances which meet the following conditions. Substances corresponding to “Not classified” are excluded, however.

Substances for which it is described in the materials in List 1 that clear reproductive toxicity* (except for small changes in sperm measurement items, incidence of spontaneous defects in fetus, variant/ossification retardation, fetal/pup body weight, and postnatal development indexes) is manifested in animal experiments at a dose at which general toxicity (which is not limited to maternal toxicity but defined as effects other than reproductive toxicity to female and male parental animals; the same shall apply
hereinafter) is not manifested in parental animals.

* The reproductive toxicity here means reproductive toxicity defined in c), that is, effects on parental sexual function, fertility, and development. The same shall apply throughout this guidance.

Category 2: Substances suspected to have toxicity for human reproduction/development

(Decision criteria)

Substances which meet any of the following conditions with information in List 1 or List 2. Substances corresponding to “Category 1” and “Not classified” are excluded, however.

a) Substances of which manifestation of clear reproductive toxicity (except for small changes in sperm measurement items, incidence of spontaneous defects in fetus, variant/ossification retardation, fetal/pup body weight, and postnatal development indexes) in animal tests at a dose at which general toxicity in parental animals is manifested is described.

It is to be noted, however, that cases are reported that indicate a relationship between serious effects on parental animals (death, significant inhibition of body weight increase, etc.) and effects on fetus (Khera KS 1984: Teratology 29, 411-416, Carny EW et. al. 2004: Toxicol. Sci. 82, 234-249, Fleeman TL et. al. 2005: Birth Defects Research (Part B) 74, 442-449). When there is a definite relationship between them, the substances are not assumed to be classified as Category 2.

b) Chemicals of which general toxicity for parental animals in animal tests is not described but clear manifestation of reproductive toxicity (except for small changes in sperm measurement items, incidence of spontaneous defects in fetus, variant/ossification retardation, fetal/pup body weight, and postnatal development indexes) is described.

(In general, the dose at which general toxicity is manifested may not be clear in review documents. In such cases, it is preferable to review the original literature and to confirm the dosage.)

(Special case)

A substance for which it is described in the materials in List 2 that clear reproductive toxicity (except for small changes in sperm measurement items, incidence of spontaneous defects in fetus, variant/ossification retardation, fetal/pup body weight, and postnatal development indexes) is manifested at a dosage at which general toxicity is not manifested is to be placed in Category 2 in this guidance since there is no sufficient proof (evidence) to classify it in Category 1B.

c) Substance of which reports on human reproductive toxicity are available that cannot
be considered to be sufficient. (Substance not classified in Category 1A) *

* This includes a case where it is described in the materials in List 2 that reproductive toxicity is recognized with humans.

Not classified: Substances presumed to have no reproductive/developmental toxicity to humans.

(Decision criteria)

If appropriate tests both for reproductive and developmental effects have been conducted and no apparent adverse effect has been detected, then it is reasonable to consider that the tested substance has no reproductive/developmental toxicity and should be determined as ‘Not classified’. In addition, when any of the following conditions is applicable, it is not appropriate to apply Category 1 or Category 2 to the tested substance. In the following cases, refer to section b) in the [3) “Points to be noted in classification”] and classification shall be performed accordingly.

a) In the case when the substance is reported to have adverse effects on reproductive function, fertility, or development, but these effects are induced as non-specific and secondary effects of other toxicity.

b) In the case when the reproductive toxicity of the substance has been proven to occur through specific mechanisms of action to the animal species tested, or when the reproductive toxicity in animals has been shown not to occur in humans because of the significant toxicokinetic difference.

c) In the case when the substance induces only non-significant or minimal effects (small changes in sperm parameters or in the incidence of spontaneous defects in the fetus, small changes in the proportion of common fetal variants/retarded ossification, or slight changes in the fetus/pup body weights or in postnatal development measures).

3) Points to be noted in classification

a) When exposure of reproductive organs to test material is at a unrealistically high level in a test using administration routes such as intravenous injection or intra-abdominal injection, or when local damage is caused to reproductive organs by irritation or other factors, the result of such a test is not used as the basis of classification. Adverse effects on reproduction recognized only at an extremely high dose (for example, a dose that induces prostration, severe inappetence, and high mortality) in an animal test are not used as the basis of classification, unless information is available of, for example, toxicokinetics indicating that humans are more susceptible than animals, supporting the appropriateness of the classification.
b) A substance for which available information regarding reproductive toxicity is determined as insufficient to make a final decision is to be placed in “Classification not possible” because sufficient information is not available for GHS classification. Expert judgment shall be used on an as needed basis.

c) Effects on or via lactation

In case descriptions regarding effects on or via lactation are found, expert judgment shall be used. The expert judges whether the substance has "effects on or via lactation" from his/her expertise based on GHS.

d) Substances requiring cautions in classification

Reference 1 cited at the end of this item lists the following substances as human teratogens. Since substances subsumed under these can be classified in “Category 1A”, information about them should be collected with special care in accordance with this guidance.

(Schardein, 2000, Table 1-18)
- Alcohol
- Anticancer agents (Aminopterin, Busulfan, Chlorambucil, Methotrexate, Cytarabine, Cyclophosphamide, Mechlorethamine)
- Androgenic hormones
- Antithyroid drugs, Aminoglycoside antibiotics
- Coumarin anticoagulants
- Diethylstilbestrol
- Methyl mercury
- PCBs
- Thalidomide
- Anticonvulsants (Hydantoin, Primidone, Carbamazepine, Diones, Valproic acid)
- Penicillamine
- Lithium
- Cocaine
- Retinoic acids
- ACE inhibitors
- Toluene, Tetracyclines

Item 1 also contains the list of substances considered to cause male-mediated developmental toxicity (Schardein, 2000, Table 1-9) and the list of example substances having toxicity to development by California Proposition 65 (Schardein, 2000, Table 1-16). The substances shown there should be examined with special care in accordance with this guidance, and information sufficient for decision should be collected.

e) Limit dose
In the UN GHS 4th revised edition 3.7.2.5.9, it is described that 1000 mg/kg can be adopted as a limit dose. When a dose is more than 1000 mg/kg, do not apply the limit dose mechanically, but judgment by expert's regarding the adoption of the limit dose shall be sought for. OECD test guidelines defining a limit dose and the limit dose defined therein are shown below.

3-2-8 Specific Target Organ Toxicity-Single Exposure

(1) Definitions

Definitions of Specific Target Organ Toxicity-Single Exposure in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(3.8.1)

3.8.1.1 The purpose of this chapter is to provide a means of classifying substances and mixtures that produce specific, non-lethal target organ toxicity arising from a single exposure. All significant health effects that can impair function, both reversible and irreversible, immediate and/or delayed and not specifically addressed in chapters 3.1 to 3.7 and 3.10 are included (see also para. 3.8.1.6).

3.8.1.2 Classification identifies the substance or mixture as being a specific target organ toxicant and, as such, it may present a potential for adverse health effects in people who are exposed to it.

3.8.1.3 Classification depends upon the availability of reliable evidence that a single exposure to the substance or mixture has produced a consistent and identifiable toxic effect in humans, or, in experimental animals, toxicologically significant changes which have affected the function or morphology of a tissue/organ, or has produced serious changes to the biochemistry or haematology of the organism and these changes are relevant for human health. It is recognized that human data will be the primary source of evidence for this hazard class.

3.8.1.4 Assessment should take into consideration not only significant changes in a single organ or biological system but also generalized changes of a less severe nature involving several organs.

3.8.1.5 Specific target organ toxicity can occur by any route that is relevant for humans, i.e. principally oral, dermal or inhalation.

3.8.1.6 Specific target organ toxicity following a repeated exposure is classified in the GHS as described in Specific target organ toxicity – Repeated exposure (Chapter 3.9) and is therefore excluded from the present chapter. Other specific toxic effects, listed below are assessed separately in the GHS and consequently are not included here:

(a) acute toxicity (Chapter 3.1);
(b) skin corrosion/irritation (Chapter 3.2);
(c) serious eye damage/eye irritation (Chapter 3.3);
(d) respiratory or skin sensitization (Chapter 3.4);
(e) germ cell mutagenicity (Chapter 3.5);
(f) carcinogenicity (Chapter 3.6);
(g) reproductive toxicity (Chapter 3.7); and
(h) aspiration toxicity (Chapter 3.10).

3.8.1.7 The classification criteria in this chapter are organized as criteria for substances Categories 1 and 2 (see 3.8.2.1), criteria for substances Category 3 (see 3.8.2.2) and criteria for mixtures (see 3.8.3).

(2) Classification criteria

A) Classification criteria based on Classification JIS

**Table 3-2-8-1: Hazard categories for Specific Target Organ Toxicity (Single Exposure)**

<table>
<thead>
<tr>
<th>Category 1</th>
<th>Substances that have produced significant toxicity in humans, or that, on the basis of evidence from studies in experimental animals can be presumed to have the potential to produce significant toxicity in humans following single exposure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Placing a substance in Category 1 is done on the basis of any of the following:</td>
<td></td>
</tr>
<tr>
<td>a) reliable and good quality evidence from human cases or epidemiological studies,</td>
<td></td>
</tr>
<tr>
<td>b) observations from appropriate studies in experimental animals in which significant and/or severe toxic effects of relevance to human health were produced at generally low exposure concentrations. <th>Transient target organ effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>There are target organ effects for which a substance/mixture may not meet the criteria to be classified in Categories 1 or 2 indicated above. These are effects which adversely alter human function for a short duration after exposure and from which humans may recover in a reasonable period without leaving significant alternation of structure or function. This category includes narcotic effects and respiratory tract irritation. Substances may be classified specifically for these</td>
<td></td>
</tr>
</tbody>
</table>
effects in accordance with B) Classification criteria in GHS: UN GHS 4th revised edition, 3.8.2.2.1 and 3.8.2.2.2.

For these categories 1 through 3, the specific target organ/system that has been primarily affected by the classified substance may be identified, or the substance may be identified as a general toxicant. Attempts should be made to determine the primary target organ of toxicity and classify for that purpose, e.g. hepatotoxicants, neurotoxicants. One should carefully evaluate the data and, where possible, not include secondary effects, e.g. a hepatotoxicant can produce secondary effects in the nervous or gastro-intestinal systems.

B) Classification criteria in GHS

The same categories are adopted for classification criteria in Classification JIS and GHS. Their guidance value ranges are also the same. For detailed descriptions, refer to the UN GHS 4th revised edition 3.8.2 about categories, and the UN GHS 4th revised edition Table 3.8.1 about guidance values.

The GHS criteria for specific target organ toxicity (single exposure) Category 3 “respiratory tract irritation” are as follows.

【GHS 4th revised edition】 (3.8.2.2.1)

The criteria for respiratory tract irritation as Category 3 are:

(a) Respiratory irritant effects (characterized by localized redness, edema, pruritus and/or pain) that impair function with symptoms such as cough, pain, choking, and breathing difficulties are included. It is recognized that this evaluation is based primarily on human data;

(b) Subjective human observations could be supported by objective measurements of clear
respiratory tract irritation (RTI) (e.g. electrophysiological responses, biomarkers of inflammation in nasal or bronchoalveolar lavage fluids;

c) The symptoms observed in humans should also be typical of those that would be produced in the exposed population rather than being an isolated idiosyncratic reaction or response triggered only in individuals with hypersensitive airways. Ambiguous reports simply of “irritation” should be excluded as this term is commonly used to describe a wide range of sensations including those such as smell, unpleasant taste, a tickling sensation, and dryness, which are outside the scope of this classification endpoint;

d) There are currently no validated animal tests that deal specifically with RTI, however, useful information may be obtained from the single and repeated inhalation toxicity tests. For example, animal studies may provide useful information in terms of clinical signs of toxicity (dyspnoea, rhinitis etc) and histopathology (e.g. hyperemia, edema, minimal inflammation, and thickened mucous layer) which are reversible and may be reflective of the characteristic clinical symptoms described above. Such animal studies can be used as part of weight of evidence evaluation;

e) This special classification would occur only when more severe organ effects including in the respiratory system are not observed.

The GHS criteria for specific target organ toxicity (single exposure) Category 3 “narcotic effects” are as follows.

【GHS 4th revised edition】 (3.8.2.2.2)
The criteria for narcotic effects as Category 3 are:

(a) Central nervous system depression including narcotic effects in humans such as drowsiness, narcosis, reduced alertness, loss of reflexes, lack of coordination, and vertigo are included. These effects can also be manifested as severe headache or nausea, and can lead to reduced judgment, dizziness, irritability, fatigue, impaired memory function, deficits in perception and coordination, reaction time, or sleepiness;

(b) Narcotic effects observed in animal studies may include lethargy, lack of coordination righting reflex, narcosis, and ataxia. If these effects are not transient in nature, then they should be considered for classification as Category 1 or 2.

(3) Items on information sources and data

* Classification procedure can be referred to "3-1-1 Sources of Information available for classification".

A) Data availability

- Sufficient information for classification cannot be obtained from simple descriptions in
existing SDSs. A literature search should be carried out for reliable reviews and primary information relevant to toxic actions.

- Substances assigned EU CLP hazard statements\(^{17}\) H370, H371, H335, or H336 related to specific target organ toxicity (single exposure) and EU DSD R-Phrases\(^{18}\) (R39, R68, R37, or R67) cause concern owing to the possibility that they may produce specific target organ toxicity (single exposure).

B) Order of Precedence when Multiple Data Exist

1) Data from evaluation by reliable organizations (for example, data obtained from reference documents shown in List 1).

2) If appropriate sources of information based on data cannot be obtained easily, try to obtain the original EU assessment documents for the EU classification corresponding to Specific Target Organ Toxicity-Single Exposure. When the assessment documents are obtained, classify on the basis of the documents.

3) Report data which can be considered to be reliable (Measurements are according to GLP, or data which are the basis of judgment are clearly shown and evaluated, etc.).

4) Data collected from other sources of information (for example, data from references shown in List 2 or 3)

C) Comparison with conventional classification systems

EU CLP H370 and EU DSD T\(^+\), R39, T, R39 correspond to Category 1. EU CLP H371 and EU DSD R68 correspond to Category 2. EU CLP H335, H336 and EU DSD R37, R67 correspond to Category 3 for single exposure: respiratory tract irritation and narcotic action, respectively.

D) Guidance concerning data

- If information on specific, non lethal, target organ toxicity arising from a single exposure are available, experts should judge whether the toxicity has significant health effects in humans or not.

- The exposure route by which the classified substance has produced damage should be specified.

- Examples are provided below of toxic effects in humans or experimental animals that must be taken into consideration in classification of specific target organ toxicity.

---

\(^{17}\) See Annex for EU hazard statements.

\(^{18}\) For R-Phrase, see Appendix.
Evidence from appropriate studies in experimental animals can furnish much more detail, in the form of clinical observations, and macroscopic and microscopic pathological examination and this can often reveal hazards that may not be life-threatening but could indicate functional impairment. Consequently all available evidence, and relevance to human health, must be taken into consideration in the classification process.

Examples of relevant toxic effects in humans and/or animals are provided below:

(a) Morbidity resulting from single exposure;
(b) Significant functional changes, more than transient in nature, in the respiratory system, central or peripheral nervous systems, other organs or other organ systems, including signs of central nervous system depression and effects on special senses (e.g. sight, hearing and sense of smell);
(c) Any consistent and significant adverse change in clinical biochemistry, haematology, or urinalysis parameters;
(d) Significant organ damage that may be noted at necropsy and/or subsequently seen or confirmed at microscopic examination;
(e) Multifocal or diffuse necrosis, fibrosis or granuloma formation in vital organs with regenerative capacity;
(f) Morphological changes that are potentially reversible but provide clear evidence of marked organ dysfunction;
(g) Evidence of appreciable cell death (including cell degeneration and reduced cell number) in vital organs incapable of regeneration.

- Hazards listed below are treated separately in the UN GHS 4th revised edition and hence are not included in specific target organ toxicity.
  - Acute Toxicity (3-2-1)
  - Skin Corrosion/Irritation (3-2-2)
  - Serious Eye Damage/Eye Irritation (3-2-3)
  - Respiratory or Skin Sensitization (3-2-4)
  - Germ Cell Mutagenicity (3-2-5)
  - Carcinogenicity (3-2-6)
  - Reproductive Toxicity (3-2-7)
  - Aspiration Hazard (3-2-10)

(4) Guidance for classification and judgment
   A) Background of this item and points to be noted
As for background of this item, refer to Part 1, Introduction.

In classification, take the following points into account.

* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, the determination of “Not classified” should be performed carefully. If there is any question, a given substance should rather be classified in “Classification not possible” due to insufficient information for judgment.

* When an affected organ can be identified, indicate the applicable category along with the affected organ in parentheses for “GHS classification.” When such an organ cannot be identified, put “systemic toxicity” in parentheses. (Example entry: Category 1 (liver, kidney, blood), or Category 1 (systemic toxicity))

* In a case where a substance can be classified in Category 1 (respiratory organs) or Category 2 (respiratory organs), it shall not be classified in Category 3 (respiratory tract irritation).

* In a case where a substance can be classified in Category 1 (central nervous system) or Category 2 (central nervous system), it can be classified in Category 3 (narcotic).

* When the same substance is classified into different categories depending on affected organs, indicate the category for each of the affected organs. (Example entry: Category 1 (liver, kidney), Category 2 (blood), Category 3 (respiratory tract irritation))

* As for substances of which data are available only for a mixture (provided mixed or diluted with solvents without toxicity), their GHS classification as chemical substances are performed by estimating from concentrations appropriately, and the estimation processes are to be described as a ground for classification.

B) Regarding classification procedure

1) Substances meeting [Decision criteria 1a] or [Decision criteria 1b] below are placed in Category 1.

[Decision criteria 1a]: Substances for which evidence of inducing toxic effects in humans are available in List 1.

(Notes)

a) Effects on organs that are obviously known to be secondary effects shall be excluded from description. Judgement by experts shall be sought for where necessary about whether the effects are secondary or not. When such a judgment is difficult, all organs affected shall be cited.

b) Effects on respiratory system by site of contact are included here, and are placed in Category 1 (pneumoconiosis, etc.). However, such effects by site of contact other than respiratory tract, for example, irritation/inflammation reaction in digestive system in a case of oral administration of a corrosive/irritant, are considered to be subsumed under
other toxicity items such as skin corrosion, and are not classified in specific target organ

toxicity.
c) In case only minimal symptoms (slight fever, languor, etc.) are reported, the substance
shall not be classified based on the data only.
d) All organs described as affected in List 1 shall be indicated. However, when organs
listed in multiple assessment documents based on the same type of tests are not the
same, indicate the commonly listed organs. When a toxic symptom alone is described
and the affected organ cannot be identified, put “systemic toxicity” instead. When the
tag organ is identified, fundamentally, a description of toxic symptom is not required.
e) When the affected organ can be identified, indicate the applicable category along with
the affected organ in parentheses in “GHS classification”. When the affected organ
cannot be identified, put “systemic toxicity” in parentheses.

[Decision criteria 1b]: Animal tests meeting all of conditions below
a) Any animal species is applicable.
b) Exposure amount is identified and toxic symptom is induced within the guidance value
range of Category 1
c) The test is described in List 1 or an OECD TG test in List 2, is according to GLP, and
has received some degree of approval (by multiple reviewers)

(Notes)
a) As for toxic effects, read the UN GHS 4th revised edition and the following documents
carefully.
b) Effects on organs that are obviously known to be secondary effects shall be excluded
from description. Judgment by experts shall be sought for where necessary as to
whether the effects are secondary or not.
c) Effects on respiratory system by site of contact are included here and are placed in
Category 1 (pneumoconiosis, etc.). However, such effects by site of contact other than
respiratory tract, for example, irritation/inflammation reaction in digestive system in a
case of oral administration of a corrosive/irritant, are considered to be subsumed under
other toxicity items such as skin corrosion and are not classified in specific target organ
toxicity.
d) In case only minimal symptoms (slight fever, etc.) are reported, the substance shall not
be classified based on the data only.
e) All organs described as affected in List 1 shall be indicated. However, when organs
listed in multiple assessment documents based on the same type of tests are not the
same, indicate the commonly listed organs. When a toxic symptom alone is described
and the affected organ cannot be identified, put “systemic toxicity” instead. When the target organ is identified, fundamentally, a description of toxic symptom is not required. f) As for conversion of exposure amount, “(3) Items on information sources and data” and “(4) Guidance for classification and judgment” of 3-2-1 Acute Toxicity in this guideline shall be used (except for the criteria for dealing with animal species difference). g) When the affected organ can be identified, indicate the applicable category along with the affected organ in parentheses in “GHS classification”. When the affected organ cannot be identified, put “systemic toxicity” in parentheses.

2) Substances meeting [Decision criteria 2a] or [Decision criteria 2b] below are placed in Category 2.

[Decision criteria 2a]: Substances for which evidence of inducing toxic effects in humans are available in List 2.

(Notes)
According to 1) [Decision criteria 1a](Notes) a) through e)

[Decision criteria 2b]: Animal tests meeting all of conditions below
a) Any animal species is applicable
b) Exposure amount is identified and toxic symptom is induced within the guidance value range of Category 2. (When multiple documents are available, judgment shall be based on one with the smallest exposure amount.)
c) The test is described in List 1 or List 2

(Notes)
According to 1) [Decision criteria 1b](Notes) a) through b)

(Exception)
When a test for any animal species in which the exposure amount is identified and is within the guidance value range of Category 1, but when the test is described in List 2 alone and does not meet the condition of [Decision criteria 1b] c) (does not meet the condition that is according to GLP and has received some degree of approval (by multiple reviewers)), substances with such test results are exceptionally classified in Category 2. Indicate as follows as special remarks, “This substance can be placed in Category 1 judging from the guidance value, but its data in List 2 alone are available, and its test does not meet the [Decision criteria 1b] c). Consequently, the substance is classified in Category 2 in accordance with the guidance.”

(Notes)
According to 1) [Decision criteria 1b](Notes) a) through b)

3) Substances applicable to [Decision criteria 3] below shall be placed in Category 3.
[Decision criteria 3]: Human evidence or animal test that meets all conditions below
a) When toxicity meeting criteria of respiratory tract irritation or classification criteria of narcotics is recognized for only a short period after exposure.
b) The effect is reversible.
c) The human evidence or animal test is listed in List 1 or List 2.

(Notes)
a) Category 3 (transient target organ effects) is defined as “effects which adversely alter human function for a short duration after exposure and from which humans may recover in a reasonable period without leaving significant alteration of structure or function”. Presently in GHS, classification criteria for Category 3 are shown regarding respiratory tract irritation and narcotic effects. When descriptions suggesting narcotic effects based on inhibition of nerve system function and action are found in the original literatures, the substance in question is to be classified in Category 3. If there is any reversible effect other than these effects, such effect shall be indicated in the special remarks in the present classification work but shall not be the basis of classification.
b) In case temporary respiratory tract irritant effects are observed, a substance shall be classified in Category 3. If more serious organs are affected, including one in the respiratory system, the substance shall be classified in Category 1 or Category 2. As for narcotic effects, only if the effect is not transient in nature, the substance shall be classified in Category 1 or Category 2.
c) Indicate whether a substance is either a respiratory tract irritant or a narcotic clearly.
(Example: Category 3 (respiratory tract irritant))

C) On treatment of vapour inhalation guidance value in classification of specific target organ toxicity (single exposure)

For the classification of specific target organ toxicity (single exposure), “guidance values” for categorization based on animal data are shown in Table 3-2-8-2 (UN GHS 4th revised edition Table 3.8.1). Vapour inhalation is indicated in the unit of mg/L. However, there are no notes regarding vapour inhalation like those for acute toxicity in Table 3.1.1. Therefore, regarding specific target organ toxicity (single exposure), the toxicity manifestation concentration in mg/L at vapour inhalation should be examined and evaluated by comparing it with the value shown in the Table 3.8.1. If the original data is given in ppmV, the data should be converted into mg/L and compared.

If the concentration is exceeding saturated vapour pressure, the value is treated as that of mist (or dust) by referring to the case of acute toxicity.
3-2-9 Specific Target Organ Toxicity-Repeated Exposure

(1)Definitions

Definitions of Specific Target Organ Toxicity-Repeated Exposure in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(3.9.1)

3.9.1.1 The purpose of this document is to provide a means of classifying substances that produce specific target organ toxicity arising from a repeated exposure. All significant health effects that can impair function, both reversible and irreversible, immediate and/or delayed are included.

3.9.1.2 Classification identifies the chemical substance as being a specific target organ toxicant and, as such, it may present a potential for adverse health effects in people who are exposed to it.

3.9.1.3 Classification depends upon the availability of reliable evidence that a repeated exposure to the substance has produced a consistent and identifiable toxic effect in humans, or, in experimental animals, toxicologically significant changes which have affected the function or morphology of a tissue/organ, or has produced serious changes to the biochemistry or haematology of the organism and these changes are relevant for human health. It is recognized that human data will be the primary source of evidence for this hazard class.

3.9.1.4 Assessment should take into consideration not only significant changes in a single organ or biological system but also generalized changes of a less severe nature involving several organs.

3.9.1.5 Specific target organ toxicity can occur by any route that is relevant for humans, i.e. principally oral, dermal or inhalation.

3.9.1.6 Non-lethal toxic effects observed after a single-event exposure are classified in the GHS as described in Specific target organ toxicity – Single exposure (Chapter 3.8) and are therefore excluded from the present chapter. Other specific toxic effects, such as acute/toxicity, serious eye damage/eye irritation, skin corrosion/irritation, respiratory or skin sensitization, carcinogenicity, germ cell mutagenicity, reproductive toxicity and aspiration toxicity are assessed separately in the GHS and consequently are not included here.
(2) Classification criteria

A) Classification criteria based on Classification JIS

Table 3-2-9-1: Hazard categories for specific target organ toxicity following repeated exposure

<table>
<thead>
<tr>
<th>Category 1: Substances that have produced significant toxicity in humans, or that, on the basis of evidence from studies in experimental animals can be presumed to have the potential to produce significant toxicity in humans following repeated exposure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Placing a substance in Category 1 is done on the basis of any of the following:</td>
</tr>
<tr>
<td>a) reliable and good quality evidence from human cases or epidemiological studies,</td>
</tr>
<tr>
<td>b) observations from appropriate studies in experimental animals in which significant and/or severe toxic effects of relevance to human health were produced at generally low exposure concentrations. Guidance dose/concentration values to be used as part of weight-of-evidence evaluation are provided in Table I.2.9.</td>
</tr>
</tbody>
</table>

Category 2: Chemicals that, on the basis of evidence from studies in experimental animals can be presumed to have the potential to be harmful to human health following repeated exposure

Placing a chemical in Category 2 is done on the basis of observations from appropriate studies in experimental animals in which significant toxic effects, of relevance to human health, were produced at generally moderate exposure concentrations. Guidance dose/concentration values are provided in Table 3.18 in order to help in classification. In exceptional cases, human evidence can also be used to place a substance in Category 2 (see Table I.2.9).

In classifying in either category, the specific target organ/system that has been temporarily affected by the classified chemical may be identified, or the chemical may be identified as a general toxicant. Attempts should be made to determine the primary target organ, organ/system of toxicity, and classify for that purpose, e.g. hepatotoxicants, neurotoxicants. One should carefully evaluate the data and, where possible, not include secondary effects, e.g. a hepatotoxicant can produce secondary effects in the nervous or gastro-intestinal systems.
Table 3-2-9-2: Guidance value ranges for toxicity-repeated exposure

</tr>
</tbody>
</table>

B) Classification criteria in GHS (Reference information)

The same categories are adopted for classification criteria in Classification JIS and GHS. Their guidance value ranges are also the same. For detailed descriptions, refer to the UN GHS 4th revised edition 3.9.2 about categories, and the UN GHS 4th revised edition Tables 3.9.1 and 3.9.2 about guidance values.

(3) Items on information sources and data

A) Data availability

- Sufficient information for classification cannot be obtained from simple descriptions in existing SDSs. A literature search should be carried out for reliable reviews and primary information relevant to toxic actions.

- Substances assigned EU CLP H372, H373 relating to specific target organ toxicity, single exposure \(^{19}\) and R-Phrases \(^{20}\) (R33, R48, or combination of these) in EU DSD classification cause concern owing to the possibility that they may produce specific target organ toxicity (repeated exposure).

- OECD test guidelines include test methods relating to Specific Target Organ Toxicity (Repeated Exposure) as below.
  - OECD TG 407  Repeated dose 28-day oral toxicity study in rodents
  - OECD TG 408  Repeated dose 90-day oral toxicity study in rodents
  - OECD TG 409  Repeated dose 90-day oral toxicity study in non-rodents
  - OECD TG 410  Repeated dose dermal toxicity: 21 / 28-day study
  - OECD TG 411  Subchronic dermal toxicity: 90-day study
  - OECD TG 412  Subacute Inhalation toxicity study: 28-day study
  - OECD TG 413  Subchronic Inhalation toxicity: 90-day study

---

\(^{19}\) See Annex for EU hazard statements.

\(^{20}\) For R-Phrase, see Appendix.
OECD TG452  Chronic Toxicity Studies

B) Order of Precedence when Multiple Data Exist
1) Data from evaluation by reliable organizations (for example, data obtained from reference documents shown in List 1.
2) If appropriate sources of information based on data cannot be obtained easily, try to obtain the original EU assessment documents from the EU DSD classification R-Phrase 21 (R48) corresponding to specific target organ toxicity-repeated exposure. When the assessment documents become available, classify on the basis of the documents.
3) Report data which can be considered to be reliable (Measurements are according to GLP, or which are the basis of judgment are clearly shown and evaluated, etc.).
4) Data collected from other sources of information (for example, data from references shown in List 2 or List 3).

C) Comparison with conventional classification systems
Substances classified as EU CLP H372 and EU DSD T, R48 corresponds to Category 1 and those classified as EU CLP H373 and EU DSD Xn, R48 correspond to Category 2.

D) Guidance concerning data
- If information on specific, non lethal, target organ toxicity arising from a single exposure are available, experts should judge whether the toxicity has significant health effects in humans or not.
- The exposure route by which the classified substance has produced damage should be specified.
- Examples are provided below of toxic effects in humans or experimental animals that must be taken into consideration in classification of specific target organ toxicity.

【GHS 4th revised edition】 (3.9.2.7.3)
Evidence from appropriate studies in experimental animals can furnish much more detail, in the form of clinical observations, haematology, clinical chemistry, macroscopic and microscopic pathological examination and this can often reveal hazards that may not be life-threatening but could indicate functional impairment. Consequently all available evidence, and relevance to human health, must be taken into consideration in the classification process. Examples of relevant toxic effects in humans and/or animals are provided below:

21 For R-Phrase, see Appendix.
(a) Morbidity or death resulting from repeated or long-term exposure. Morbidity or death may result from repeated exposure, even to relatively low doses/concentrations, due to bioaccumulation of the substance or its metabolites, or due to the overwhelming of the detoxification process by repeated exposure;

(b) Significant functional changes in the central or peripheral nervous systems or other organ systems, including signs of central nervous system depression and effects on special senses (e.g. sight, hearing and sense of smell);

(c) Any consistent and significant adverse change in clinical biochemistry, haematology, or urinalysis parameters;

(d) Significant organ damage that may be noted at necropsy and/or subsequently seen or confirmed at microscopic examination;

(e) Multifocal or diffuse necrosis, fibrosis or granuloma formation in vital organs with regenerative capacity;

(f) Morphological changes that are potentially reversible but provide clear evidence of marked organ dysfunction (e.g. severe fatty change in the liver);

(g) Evidence of appreciable cell death (including cell degeneration and reduced cell number) in vital organs incapable of regeneration.

Hazards listed below are treated separately in the UN GHS 4th revised edition and hence are not included in specific target organ toxicity.

- Acute Toxicity (3-2-1)
- Skin Corrosion/Irritation (3-2-2)
- Serious Eye Damage/Eye Irritation (3-2-3)
- Respiratory or Skin Sensitization (3-2-4)
- Germ Cell Mutagenicity (3-2-5)
- Carcinogenicity (3-2-6)
- Reproductive Toxicity (3-2-7)
- Aspiration Hazard (3-2-10)

(4) Guidance for classification and judgment

A) Background of this item and points to be noted

As for background of this item, refer to Part 1, Introduction.

In classification, take the following points into account.

* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, the determination of “Not classified” should be performed carefully. When determining as “Not classified”, clearly show the evidence for “Not classified” such as the route and the testing method being the basis of the judgment. If
there is any question, a given substance should rather be classified in “Classification not possible” due to insufficient information for judgment.

*When an affected organ can be identified, indicate the applicable category along with the affected organ in parentheses. When the organ cannot be identified, put “systemic toxicity” in parentheses. (Example entry: Category 1 (liver, kidney, blood), or Category 1 (systemic toxicity))

* When the same substance is classified into different categories depending on the affected organs, indicate the category for each of the affected organs. (Example entry: Category 1 (liver, kidney), Category 2 (blood)).

* As for substances of which only mixture data are available (provided mixed or diluted with solvents without toxicity), their GHS classification as chemical substances are performed by estimating from concentrations appropriately, and the estimation processes are to be described as a ground for classification.

B) Regarding classification procedure

1) Substances meeting [Decision criteria 1a] or [Decision criteria 1b] below are placed in “Category 1”.

[Decision criteria 1a]: Substances for which evidence of inducing toxic effects in humans are available in List 1.

(Notes)

a) Effects on organs that are obviously known to be secondary effects shall be excluded from the description. Judgment by expert shall be sought for where necessary about whether the effects are secondary effects or not. When such a judgment is difficult, all organs affected shall be cited.

b) Effects on respiratory system by site of contact are included here, and are placed in Category 1 (pneumoconiosis, etc.). However, such effects by site of contact other than respiratory tract, for example, irritation/inflammation reaction in digestive system in a case of oral administration of a corrosive/irritant, are considered to be subsumed under other toxicity items such as skin corrosion and are not classified into specific target organ.

c) In case only minimal symptoms (slight fever, languor, etc.) are reported, the substance shall not be classified based on the data only.

d) All organs described as affected in List 1 shall be indicated. However, when organs listed in multiple assessment documents based on the same type of tests are not the same, indicate the commonly listed organs. When a toxic symptom alone is described and the affected organ cannot be identified, put “systemic toxicity” instead. When the target organ is identified, fundamentally, description of toxic symptom is not required.
e) When the affected organ can be identified, indicate the applicable category along with the affected organs given in parentheses is indicated in “GHS classification”. When the affected organ cannot be identified, put “systemic toxicity” in parentheses.

[Decision criteria 1b]: Animal tests meeting all of conditions below
a) Any animal species is applicable
b) Exposure amount is identified and is induced within the guidance value range of Category 1
c) The test is described in List 1 or an OECD TG test in List 2, is according to GLP, and has received some degree of approval (review by plural persons)

(Animal tests)
- A standard animal test is a 28-day, 90-day or life test (up to 2 years) in rats or mice, and includes hematological examination, clinical chemical examination, and close macroscopic and histopathological examinations to demonstrate toxic effects on target tissues/organs.
- Refer also to data of repeated dose studies conducted using animal species other than rat and mouse.
- Take into account that other long-term exposure tests, such as a carcinogenicity test, neurotoxicity test or reproductive toxicity test, can provide evidence of specific target organ toxicity used for classification evaluation.

(Notes)
a) As for toxic effects, read the UN GHS 4th revised edition and the following documents carefully.
b) Effects on organs that are obviously known to be secondary effects shall be excluded from the description. Judgment by experts shall be sought for where necessary as to whether the effects are secondary effects or not.
c) Effects on respiratory system by site of contact are included here and are placed in Category 1 (pneumoconiosis, etc.). However, such effects by site of contact in other than respiratory tract, for example, irritation/inflammation reaction in digestive system in a case of oral administration of a corrosive/irritant, are considered to be subsumed under other toxicity items such as skin corrosion and are not classified in specific target organ toxicity.
d) In case only minimal symptoms (slight fever, etc.) are reported, the substance shall not be classified based on the data only.
e) All organs described as affected in List 1 shall be indicated. However, when descriptions of organs listed in multiple assessment documents based on the same type
of tests are the same, indicate the commonly listed organs. When a toxic symptom alone is described and the affected organ cannot be identified, put “systemic toxicity” instead. When the target organ is identified, fundamentally, description of toxic symptom is not required.

f) Data required for repeated exposure include those for repeated exposure for 14 days or more (and in case of inhalation exposure, exposure period is one hour or more for each exposure). When comparing the exposure amount with the guidance value, the guidance value shall be corrected (inverse proportional calculation by the number of exposed day and exposed time per day) by comparing the number of days and exposed time per day with the conditions of the guidance value (90 days, 6 hours/day). When repeated exposure period is longer than 90 days, however, the exposure time per day alone shall be corrected, and correction by the number of days shall not be performed.

g) When the affected organ can be identified, indicate the applicable category along with the affected organ given in parentheses in “GHS classification”. When the affected organ cannot be identified, put “systemic toxicity” in parentheses. (Example entry: Category 1 (liver, kidney, blood), or Category 1 (systemic toxicity))

2) Substances meeting [Decision criteria 2a] or [Decision criteria 2b] below are placed in Category 2.

[Decision criteria 2a]: Substances for which evidence of inducing toxic effects in humans are available in List 2.

(Notes)
According to 1) [Decision criteria 1a](Notes) a) through e)

[Decision criteria 2b]: Animal tests meeting all of conditions below
   a) Any animal species is applicable
   b) Exposure amount is identified and toxic symptom is induced within the guidance value range of Category 2. (When multiple documents are available, judgment shall be based on one with the smallest exposure amount.)
   c) The test that is described in List 1 or List 2

(Exception)
   When a test for any animal species in which the exposure amount is identified and is within the guidance value range of Category 1, but when the test is described in List 2 alone and does not meet the condition of [Decision criteria 1b] c) (does not meet the condition that is according to GLP and has received some degree of approval (by multiple reviewers)), substances with such test results are exceptionally classified in
Category 2. Indicate as follows as special remarks, "This substance can be placed in Category 1 judging from the guidance value, but its data in List 2 alone are available, and its test does not meet the [Decision criteria 1b] c). Consequently, the substance is classified in Category 2 in accordance with the guidance.

(Notes)
According to 1) [Decision criteria 1b] (Notes) a) through g)

C) On treatment of vapour inhalation guidance value in classification of specific target organ toxicity (repeated exposure)

As for the classification of specific target organ toxicity (repeated exposure), “guidance values” for categorization based on animal data are shown in Table 3-2-9-2 (UN GHS 4th revised edition tables 3.9.1 and 3.9.2). Vapour inhalation is indicated in the unit of mg/L. However, there are no notes regarding vapour inhalation like for Acute Toxicity in Table 3.1.1, neither in UN GHS 4th revised edition. Therefore, regarding Specific Target Organ Toxicity (Repeated Exposure), the toxicity manifestation concentration in unit of mg/L at vapour inhalation should be examined, and evaluated by comparing it with the value shown in the Table. If the original data is given in ppmV, the data should be converted into mg/L, and compared.

If the concentration is exceeding saturated vapour pressure, the value is treated as that of mist (or dust) by referring to the case of acute toxicity.
3-2-10 Aspiration Hazard

(1) Definitions

Definitions of Aspiration Hazard in UN GHS are as follows, and they are adopted in this guidance.

【GHS 4th revised edition】(3.10.1)

3.10.1.1 The purpose of this chapter is to provide a means of classifying substances or mixtures that may pose an aspiration toxicity hazard to humans.

3.10.1.2 Aspiration means the entry of a liquid or solid chemical product directly through the oral or nasal cavity, or indirectly from vomiting, into the trachea and lower respiratory system.

3.10.1.3 Aspiration toxicity includes severe acute effects such as chemical pneumonia, varying degrees of pulmonary injury or death following aspiration.

3.10.1.4 Aspiration is initiated at the moment of inspiration, in the time required to take one breath, as the causative material lodges at the crossroad of the upper respiratory and digestive tracts in the laryngopharyngeal region.

3.10.1.5 Aspiration of a substance or mixture can occur as it is vomited following ingestion. This may have consequences for labeling, particularly where, due to acute toxicity, a recommendation may be considered to induce vomiting after ingestion. However, if the substance/mixture also presents an aspiration toxicity hazard, the recommendation to induce vomiting may need to be modified.

3.10.1.6 Specific considerations

3.10.1.6.1 A review of the medical literature on chemical aspiration revealed that some hydrocarbons (petroleum distillates) and certain chlorinated hydrocarbons have been shown to pose an aspiration hazard in humans. Primary alcohols and ketones have been shown to pose an aspiration hazard only in animal studies.

3.10.1.6.2 While a methodology for determination of aspiration hazard in animals has been utilized, it has not been standardized. Positive experimental evidence with animals can only serve as a guide to possible aspiration toxicity in humans. Particular care must be taken in evaluating animal data for aspiration hazards.

3.10.1.6.3 The classification criteria refer to kinematic viscosity. The following provides the conversion between dynamic and kinematic viscosity:

\[
\text{Dynamic viscosity (mPa} \cdot \text{s)} / \text{Density (g/cm}^3\text{)} = \text{Kinematic viscosity (mm}^2/\text{s)}
\]

3.10.1.6.4 Although the definition of aspiration in 3.10.1.2 includes the entry of solids into the respiratory system, classification according to (b) in table 3.10.1 for Category 1 or for Category 2 is intended to apply to liquid substances and mixtures only.

3.10.1.6.5 Classification of aerosol/mist products

Aerosol and mist products are usually dispensed in containers such as self-pressurized
containers trigger and pump sprayers. The key to classifying these products is whether a pool of product is formed in the mouth, which then may be aspirated. If the mist or aerosol from a pressurized container is fine, a pool may not be formed. On the other hand, if a pressurized container dispenses product in a stream, a pool may be formed that may then be aspirated. Usually, the mist produced by trigger and pump sprayers is coarse and therefore, a pool may be formed that then may be aspirated. When the pump mechanism may be removed and contents are available to be swallowed then the classification of the products should be considered.

(2) Classification criteria

A) Classification criteria based on Classification JIS

<table>
<thead>
<tr>
<th>Categories</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| Category 1: Chemicals known to cause human aspiration toxicity hazards or to be regarded as if they cause human aspiration toxicity hazard | A substance is classified in Category 1:  
(a) Based on reliable and good quality human evidence (See note 1); or  
(b) If it is a hydrocarbon and has a kinematic viscosity \( \leq 20.5 \text{ mm}^2/\text{s} \), measured at 40°C. |

Note: Examples of chemicals included in Category 1 are certain hydrocarbons, turpentine, and pine oil.

B) Classification criteria in GHS (Reference information)

In GHS classification, in addition to Classification JIS, category 2 is set. Explanation of classification criteria by GHS is as follows.

<table>
<thead>
<tr>
<th>Categories</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| **Category 1**: Chemicals known to cause human aspiration toxicity hazards or to be regarded as if they cause human aspiration toxicity hazard | A substance is classified in Category 1:  
(a) Based on reliable and good quality human evidence (See Note 1); or  
(b) If it is a hydrocarbon and has a kinematic viscosity \( \leq 20.5 \text{ mm}^2/\text{s} \), measured at 40°C. |

<table>
<thead>
<tr>
<th>Categories</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category 2</strong>: Chemicals which cause concern owing to the presumption that</td>
<td>On the basis of existing animal studies and expert judgment that takes into account surface tension, water solubility, boiling point, and volatility, substances, other than those classified in</td>
</tr>
</tbody>
</table>
they cause human aspiration toxicity hazard Category 1, which have a kinematic viscosity≤14mm²/s, measured at 40°C (See Note 2).

**NOTE 1:** Examples of substances included in Category 1 are certain hydrocarbons, turpentine and pine oil.

**NOTE 2:** Taking this into account, some authorities would consider the following to be included in this Category: n-primary alcohols with a composition of at least 3 carbon atoms but not more than 13; isobutyl alcohol, and ketones with a composition of no more than 13 carbon atoms.

* It should be noted that in the GHS 4th revised edition, it is described as “Although the definition of aspiration includes the entry of solids into the respiratory system, classification according to (b) in UN GHS table 3.10.1 for Category 1 or Category 2 is intended to apply to liquid substances and mixtures only” (3.10.1.6.4).

(3) Items on information sources and data

* Regarding procedure of classification, refer to “3-1-1 Sources of information available for classification”

A) Data availability

Although some methodologies for determining aspiration hazards in animals have been utilized, none of them has been standardized. Positive test evidence with animal merely serves as a guide to possible aspiration toxicity hazard to humans.

B) Order of Precedence when Multiple Data Exist

Refer to “3-1-2 Order of Precedence when Multiple Data Exist”.

C) Comparison with conventional classification systems

EU CLP H304 and EU DSD R65 correspond to Category 1.

D) Guidance concerning data

- A review of the medical literature on chemical aspiration (for example, WHO/IPCS “ICSC card”) revealed that some hydrocarbons (petroleum distillates) and certain chlorinated hydrocarbons have been shown to pose an aspiration hazard to humans. Primary alcohols and ketones have been shown to pose an aspiration hazard only in animal studies.
- Examples of substances falling under Category 1 and Category 2 are shown in (2) Classification criteria B), the UN GHS 4th revised edition, and Notes 1 and 2 of Table 3.10.1, respectively.
- The classification criteria refer to kinematic viscosity. The conversion formula between dynamic viscosity and kinematic viscosity is indicated below.
Dynamic viscosity (mPa·s) / Density (g/cm³) = Kinematic viscosity (mm²/s)

(4) Guidance for classification and judgment

A) Background of this item and points to be noted

As for background of this item, refer to Part 1, Introduction.

In classification, take the following points into account.

* Unless a description that definitely denies hazards or recognizes extremely low hazards is available in List 1, the determination of “Not classified” should be performed carefully. If there is any question, a given substance should rather be classified in “Classification not possible” due to insufficient information for judgment.

* If data are available only for a mixture, the mixture itself is classified, and this shall be stated in "Grounds".

* As for Aspiration hazard, a substance shall be assigned to “Classification not possible” instead of assigning it to “Not classified” in classification JIS with the judgment that the substance does not fall into UN GHS category 1 on the grounds that it falls into UN GHS Category 2.

B) Regarding classification procedure

1) A substance meeting [Decision Criteria 1a] or [Decision Criteria 1b] shall be placed in Category 1.

[Decision Criteria 1a]: A document in List 1 or List 2 contains a description to the effect that human chemical pneumonia was caused by accidental aspiration.

(Notes)

a) Any kinematic viscosity shall not be considered.

b) Liquids and solids, not gases, are subject to classification. Since aspiration hazard concerns, not aspiration of substances suspended in gas phase, accidental aspiration of liquids and solids, aerosol/dust/mist substances are judged by referring to the UN GHS 4th revised edition 3.10.1.6.5 and considering nature of substances, performance of the containers in which the substances are provided (spray can, etc.), etc. (Substances aspirated into respiratory tract/respiratory system while suspended in gas phase are placed in “Not applicable”).

[Decision Criteria 1b]: A substance which is a hydrocarbon and has kinematic viscosity of 20.5 mm²/s or less at 40 °C.

(Notes)

a) The existence or absence of human evidence shall not be considered.

b) Viscosity depends on temperature, and that of liquids generally become smaller as temperature rises. Therefore, as for liquids, the substance with kinematic viscosity of
20.5 mm²/s or less at ambient temperature is placed in Category 1. Since, however, the dependence of liquid viscosity on temperature is not linear in most cases, it is preferable to confirm the viscosity of the substance at 40 °C by referring to chemical technology books such as the Chemical Technology Handbook, or to estimate it by using the empirical formula recognized for the substance. The basic data such as the value of viscosity and measuring temperature and their references shall be given in “Grounds”.

c) liquids and solids, not gases, are subject to classification. Since aspiration hazard concerns, not aspiration of substances suspended in gas phase, but to accidental aspiration of liquids and solids, aerosol/dust/mist substances are judged by referring to the UN GHS 4th revised edition 3.10.1.6.5, and considering nature of substances, performance of the containers in which the substances are provided (spray can, etc.), etc. (Substances aspirated into respiratory tract/respiratory system while suspended in gas phase are placed in “Not applicable”).

d) In this guidance, “hydrocarbon” means substances consisting of carbon and hydrogen including nonlinear ones, but halogenized hydrocarbon is not included.

(General notes regarding kinematic viscosity)

(Note 1) In many cases, viscosity is indicated in cgs units (dyn · s/cm² = poise(or P)). Use the following conversion formula when appropriate.

\[ 1 \text{ poise} = 0.1 \text{Pa} \cdot \text{s} \]

(Note 2) The classification criteria refer to kinematic viscosity. The conversion formula between dynamic viscosity and kinematic viscosity is indicated below. It should be noted that both of SI unit and CGS unit are used in the formula.

\[ \text{Dynamic viscosity (mPa} \cdot \text{s) / Density (g/cm}^3) = \text{Kinematic viscosity (mm}^2/\text{s)} \]
Part 4 Environmental Hazards Guidance

4-1 Information available for classification

4-1-1 Sources of Information available for classification

In UN GHS, available data are reviewed for classification. In this guidance, procedures are shown below to reduce variations in classification results as much as possible, while facilitating classification.

Upon conducting surveys for classification, firstly review the assessment documents shown in List 1 and look for information on the relevant substances.

If the required information cannot be obtained from sources in List 1, repeat the process with sources in List 2.

In principle, the below Lists shall be used for classification. This should not limit the use of reliable and useful information sources other than those listed here.

It should be noted that if any literature in the list requires confirmation of reliability, its original should be reviewed. If its reliability is low, the literature shall not be used for classification.

It is preferable to obtain the latest information of the below on-line sites, which are updated when appropriate.
(1) Sources for test data for Hazardous to the aquatic environment

List 1:

Information sources provided by international organizations, governments of major countries, etc., and whose reliability is recognized. Basically, these are assessment documents and books whose primary reference can be traced and whose accuracy can be confirmed whenever needed.

The following information can also be searched at, the National Institute for Environmental Studies, “Webkis-plus”, Chemical Safety Database (http://db-out3.nies.go.jp/kis-plus/) and eChemPortal (http://www.echemportal.org/echemportal/substancesearch/page.action?pageID=0), for example.

  Environmental Hazard Classification (N-Class)”: http://apps.kemi.se/nclass/default.asp
  Database jointly developed by ECB and The Nordic Council of ministers, which provides
  information about N(R50-53) in the EU hazardous substances list

3-3) EU classification

- Classification based on Table 3-1, Annex VI of EU CLP regulations (hereinafter abbreviated as
  “EU CLP classification”. R-phrases are of EU DSD classification) can be reference for GHS
  classification.

  Fundamentally, classification shall be performed based on quality, reliability, and consistency of
  evidence obtained from the information source, with the evidence weighted and expert’s judgment
  added where appropriate.

  In this guidance, classification based on the Annex VI of EU CLP regulations is referred to as
  EU CLP classification, and R-Phrase is referred to as EU DSD classification. EU classification
  refers to both EU CLP classification and EU DSD classification, unless otherwise specified.
(2) Sources of information for data on bioaccumulativity and degradability

List 1:

4-2 Classification of Hazardous to the Environment

“Hazardous to the aquatic environment” and “Hazardous to the ozone layer” was firstly defined in UN GHS 3rd edition and its environmental hazards, which are stipulated in Chapters 4.1 and 4.2 of the UN GHS 4th edition, respectively. Classification JIS has also reflected these updates. In addition, for “aquatic environmental hazards”, there are Annex 9 “Guideline on Hazards to the Aquatic Environment” and Annex 10 “Guidance on Transformation/Dissolution of Metals and Metal Compounds” of UN GHS 4th edition. GHS classification shall be performed by referring to them.

On the other hand, classification of substances with regard to “Hazardous to the ozone layer” shall be performed referring to Chapter 4.2 of UN GHS 4th edition.

4-2-1 Hazardous to the Aquatic Environment

(1) Definitions

Definitions by UN GHS are used in this guidance.

<table>
<thead>
<tr>
<th><strong>GHS 4th revised edition</strong> (4.1.1.1)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Acute aquatic toxicity</strong> means the intrinsic property of a substance to be injurious to an organism in a short-term aquatic exposure to that substance.</td>
</tr>
<tr>
<td><strong>Acute (short-term) hazard</strong>, for classification purposes, means the hazard of a chemical caused by its acute toxicity to an organism during short-term aquatic exposure to that chemical.</td>
</tr>
<tr>
<td><strong>Availability</strong> of a substance means the extent to which this substance becomes a soluble or disaggregate species. For metal availability, the extent to which the metal ion portion of a metal (M (^{-})) compound can disaggregate from the rest of the compound (molecule).</td>
</tr>
<tr>
<td><strong>Bioavailability</strong> (or biological availability) means the extent to which a substance is taken up by an organism, and distributed to an area within the organism. It is dependent upon physico-chemical properties of the substance, anatomy and physiology of the organism, pharmacokinetics, and route of exposure. Availability is not a prerequisite for bioavailability.</td>
</tr>
<tr>
<td><strong>Bioaccumulation</strong> means net result of uptake, transformation and elimination of a substance in an organism due to all routes of exposure (i.e. air, water, sediment/soil and food).</td>
</tr>
<tr>
<td><strong>Bioconcentration</strong> means net result of uptake, transformation and elimination of a substance in an organism due to waterborne exposure.</td>
</tr>
<tr>
<td><strong>Chronic aquatic toxicity</strong> means the intrinsic property of a substance to cause adverse effects to aquatic organisms during aquatic exposures which are determined in relation to the life-cycle of the organism.</td>
</tr>
</tbody>
</table>
| **Complex mixtures** or multi-component substances or complex substances means mixtures comprising a complex mix of individual substances with different solubilities and physico-chemical properties. In most cases, they can be characterized as a homologous series of
substances with a certain range of carbon chain length/number of degree of substitution.

_Degradation_ means the decomposition of organic molecules to smaller molecules and eventually to carbon dioxide, water and salts.

_EC_\text{x} means the concentration associated with x% response.

_Long-term hazard_, for classification purposes, means the hazard of a chemical caused by its chronic toxicity following long-term exposure in the aquatic environment.

_NOEC (No Observed Effect Concentration) means the test concentration immediately below the lowest tested concentration with statistically significant adverse effect. The NOEC has no statistically significant adverse effect compared to the control.

(2)Classification criteria

Categories for substances hazardous to the aquatic environment and the classification for substances considered long-term hazardous to the aquatic environment are shown in Table 4-2-1-1 and Figure 4-2-1-1, respectively.

The criteria for classification of a substance into categories Chronic 1 to 3 follow a tiered approach where the first step is to see if available information on chronic toxicity and degradability merits long-term hazard classification. In absence of adequate chronic toxicity data, the subsequent step is to combine acute toxicity data and environmental fate data (degradability and bioaccumulation data) and classify the substance according to the most stringent outcome.
Table 4-2-1-1: Categories for substances hazardous to the aquatic environment (Note 1)

a) Acute (short-term) aquatic hazard (Note 2)

| d) Chronic (long-term) aquatic hazard: substances for which adequate chronic toxicity data are not available |
|---|---|
| **Category Chronic 1 is assigned based on any of the following (Note1):** |
| 96 hr LC₅₀ (for fish) ≤ 1 mg/L and/or |
| 48 hr EC₅₀ (for crustacea) ≤ 1 mg/L and/or |
| 72 or 96 hr ErC₅₀ (for algae or other aquatic plants) ≤ 1 mg/L |
| and the substance is not rapidly degradable and/or the experimentally determined BCF is ≥ 500 (or, if absent, the log Kₗw ≥ 4). |

| **Category Chronic 2 is assigned based on any of the following:** |
| 96 hr LC₅₀ (for fish) > 1 but ≤ 10 mg/L and/or |
| 48 hr EC₅₀ (for crustacea) > 1 but ≤ 10 mg/L and/or |
| 72 or 96 hr ErC₅₀ (for algae or other aquatic plants) > 1 but ≤ 10 mg/L |
| and the substance is not rapidly degradable and/or the experimentally determined BCF is ≥ 500 (or, if absent, the log Kₗw ≥ 4). |

| **Category Chronic 3 is assigned based on any of the following:** |
| 96 hr LC₅₀ (for fish) > 10 but ≤ 100 mg/L and/or |
| 48 hr EC₅₀ (for crustacea) > 10 but ≤ 100 mg/L and/or |
| 72 or 96 hr ErC₅₀ (for algae or other aquatic plants) > 10 but ≤ 100 mg/L |
| and the substance is not rapidly degradable and/or the experimentally determined BCF is ≥ 500 (or, if absent, the log Kₗw ≥ 4)  (Note 4 and Note 5) |

e) “Safety net” classification

**Category: Chronic 4**

Poorly soluble substances for which no acute toxicity is recorded at levels up to the water solubility, and which are not rapidly degradable and have a log Kₗw ≥4, indicating a potential to bioaccumulate, will be classified in this category unless other scientific evidence exists showing classification to be unnecessary. Such evidence would include an experimentally determined BCF <500, or a chronic toxicity NOECs >1 mg/l, or evidence of degradation in the environment.

Note 1: The organic fish, Crustacea and algae are tested as surrogate species covering a range of trophic levels and taxa, and the test methods are highly standardized. Data on other
organisms may also be considered, however, provided they represent equivalent species and test endpoints.

Note 2: When classifying substances as Acute 1 and/or Chronic 1 it is necessary at the same time to indicate an appropriate M factor (*2) to apply the summation method (*1).

Note 3: Where the algal toxicity ErC₅₀ [=EC₅₀ (growth rate)] falls more than 100 times below the next most sensitive species and results in a classification based solely on this effect, consideration by experts should be used to decide whether this toxicity is representative of the toxicity to aquatic plants. Classification should be based on ErC₅₀. In circumstances where the basis of EC₅₀ is not specified and no ErC₅₀ is recorded, classification should be based on the data.

Note 4: Lack of rapid degradability is based on either a lack of ready biodegradability or other evidence of lack of rapid degradation. When no useful data on degradability are available, either experimentally determined or estimated data, the substance should be regarded as not rapidly degradable.

Note 5: Potential to bioaccumulate, based on an experimentally derived BCF≥500 or, if absent, a log K_{ow}≥4, provided log K_{ow} is an appropriate descriptor for the bioaccumulation potential of the substance. Measured log K_{ow} values take precedence over estimated values and measured BCF values take precedence over log K_{ow} values.

(*1: A method of classifying hazardous mixture by summing up its ingredients classified.
(*2: A coefficient to add weight in applying the summation method to classification of a mixture containing ingredients with high toxicity.)
Figure 4-2-1-1  Categories for substances long-term hazardous to the aquatic environment

Are there adequate chronic toxicity data available for all three trophic levels?

- Yes: Classify according to the criteria given in Table 4-2-1-1.b) or 4-2-1-1.c).

- No: Are there adequate chronic toxicity data available for one or two trophic levels?

  - Yes: Assess both:
    a) according to the criteria given in Table 4-2-1-1.b) or 4-2-1-1.c) depending on information on rapid degradation, and
    b) (if for the other trophic level(s) adequate acute toxicity data are available) according to the criteria given in Table 4-2-1-1.d), and classify according to the most stringent.

  - No: Are there adequate acute toxicity data available?

    - Yes: Classify according to the criteria given in Table 4-2-1-1.d).
From the above, classification scheme for substances hazardous to the aquatic environment is shown in Table 4-2-1-2.

</tbody>
</table>
|                          | Note 2                | Substances are classified in the various chronic categories unless there are adequate chronic toxicity data available for all three trophic levels above the water solubility on above 1 mg/L. (“Adequate” means that the data sufficiently cover the endpoint of
concern. Generally this would mean measured test data, but in order to avoid unnecessary testing it can, on a case-by-case basis, also be estimated data, e.g. (Q)SAR, or for obvious cases expert judgment).

Note 3 Chronic toxicity refers to the intrinsic property of a substance to cause adverse effects to species during exposures which are determined in relation to the life-cycle of the species. Chronic toxicity band based on NOEC (mg/L) or equivalent Cx (mg/L) values (usually x=10%) for fish or crustacea.

Note 4 The system also introduces a “safety net” classification (referred to as category Chronic 4) for use when the data available do not allow classification under the formal criteria but there are nevertheless some grounds for concern.

Note 5 For poorly soluble substances for which no acute toxicity has been demonstrated at the solubility limit, and are both not rapidly degraded and have a potential to bioaccumulate, this category should apply unless it can be demonstrated that the substance does not require classification for aquatic long-term hazards.
(3) Items on information sources and data

A) Data availability

Most information sources (shown in 4-1) of data for classification on acute aquatic toxicity, bioconcentration (Bioconcentration factor, octanol/water partition coefficient), rapid degradability (biotic or abiotic), and chronic aquatic toxicity can be easily accessed from web sites. Broad collection of related information is important since data on stability of substances in water, water-solubilities, etc. are also used in classification.

Even if EU classification results which are similar to GHS classification are available as reference information, they cannot be directly used in GHS classification since classification criteria for chronic aquatic toxicity in EU classification are different from those in GHS classification and since its evidence information is hard to obtain.

B) Requirements for data to be collected and utilized

1) Information on hazardous to the aquatic environment

a) Requirements for data to be collected

Tests shall be conducted by using fish, crustacea, and algae (or other aquatic plants) -especially, organisms recommended by standard test methods such as OECD test guidelines and ASTM or their congener.

The test period and endpoints (effect indicators) are as follows:

- Fish: 96 hour LC₅₀ (lethal)
- Crustacea: 24 or 48 hour EC₅₀ (immobile), LC₅₀ (lethal)
- Daphnia: 24 or 48 hour EC₅₀ (immobile), LC₅₀ (lethal)
- Decapoda, Amphipoda, Mysidacea: 24, 48, or 96 hour EC₅₀ (immobile), LC₅₀ (lethal)
- Algae (or other aquatic plants): 72 or 96 hour (for cyanobacteria) with Algae, seven day or 14 day with ErC₅₀ (growth rate method: the concentration at which mean growth rate during test period is inhibited by 50%) and other higher aquatic plants (for example, Lemma sp). Although data for less than seven days are available, they should not be used because these toxicity values from short test period often cause underestimation of toxicity.

As toxicity indexes, TLm (median Tolerance Limit) is treated as the same with LC₅₀, and IC₅₀ (50% inhibition concentration), with EC₅₀.

Also, estimated values related to aquatic environmental hazards shall not be used in this guidance.

b) Requirements for usable data

In principle, data according to GLP shall be used. Yet, even if it is not clear or is not
the case that a test is according to GLP, if an expert judged that the test is reliable based on its detailed information (preferably from primary literature), the data from the test are used for categorization judgment. Even if the test is conducted according to GLP, if an expert judged that there is a doubt about the applied test procedure from the scientific point of view, the data from the test shall not be used as the basis of classification. Especially, when acute aquatic toxicity levels are above the water solubility, data shall not be used for classification in principle.

As for the concept of hazard evaluation for poorly water-soluble substances (handling of toxicity levels over water-solubility), refer to descriptions regarding difficult to test substances in the UN GHS 4th revised edition Annex 9. When almost all of the parent substance is degraded for the duration of the test and the remaining degradation products are recognized to be toxic, the toxicity of the degradation products are considered to be that of the parent substance (as for handling of degradation products, refer to the UN GHS 4th revised edition Annex 9 A9.2.6.3). In such cases, it is preferable to note that the classification is based on the hazard especially from the degradation products.

It is required for aquatic toxicity test because of its characteristics that a testing substance should be dissolved in aqueous medium where bioavailable exposure concentration is stably maintained during the test period.

Standard test methods and test conditions to be applied to individual organism groups are shown below.

In the below reliable data (e.g. List 1), if a test result is in accordance with the below test guidelines, etc., but the organism species, or other test conditions are different, expert judgment shall be used to decide adoption of the data.

**Fish:**

In tests using fish, 96 hour LC$_{50}$ is used which is according to OECD test guideline 203 or corresponding test methods.

**Crustacea:**

In tests using crustacea, 48 hour EC50 according to OECD test guideline 202 (Daphnia Acute Immobilization test) or corresponding test methods should be the standard test. If 48 hour EC50 is not available, 24 hour EC50 (according to the previous OECD test guideline 202) may be referred.

Except for tests using Daphnia younger than 24 hours, the values of 96 hour LC$_{50}$ from, for example, tests using Mysidacea or other species, US EPA850.1035 (Mysidacea Acute Toxicity), or corresponding tests may be used. When data according to OECD-TG (1984 or 2004) are not available, 24 or 48 hour LC$_{50}$ (not immobile but lethal) may be adopted. For any useful information source (e.g. List 2)
requires expert judgment.

- Algae, Cyanobacteria (Cyanophyceae), and higher aquatic plants: OECD test guideline 201 (revised in 2006) is a growth inhibition test for Algae and Cyanobacteria (Cyanophyceae). Algae growth inhibition test is a chronic test, where EC_{50} is regarded as acute toxicity data for classification purpose. This EC_{50} is generally obtained based on the reduction of growth rate (Growth rate method: hereinafter abbreviated to as ErC). It should be noted that in case only EC_{50} from decrease in biomass (called area method/biomass method and abbreviated as EbC) at the completion of the test is available or calculation method to obtain EC_{50} is not clearly identified, these data may be used. Data with exposure time longer than 96 hours shall not be used.

- Other higher aquatic plants: OECD test guideline 221 (approved in 2006) showing a growth inhibition test method using a higher plant, Lemna, and acute EC_{50} according to US EPA850.4400 may be utilized. As in the case of Algae, ErC_{50} (rate method) takes precedence over other toxicity values. If it is not clear whether obtained data based on the rate method or others such as area method, the data may be tentatively used. Data with exposure time of seven days take precedence over that of 14 days, and data with exposure time of less than seven days should not be used because such data often cause underestimation of toxicity.

2) Test data on chronic aquatic toxicity

In the UN GHS 3rd revised edition, chronic aquatic toxicity categories are agreed to be categorized based on chronic aquatic toxicity values.

a) Requirements for data to be collected

Tests shall be conducted by using fish, crustacea, and algae (or other aquatic plants) -especially, their species recommended by standard test methods such as OECD test guidelines and ASTM or their congeners.

The exposure time and endpoints (effect indicators) are as follows:

- Fish: in early life stage test, 28 days or more (varies depending on the kind of fish), NOEC (hatching success rate, growth (length and weight changes), and survival rate, etc.)
- Crustacea (daphnia and mysidacea): 7 days or more (21 days in *Daphnia magna*, 7 days in *Ceriodaphnia dubia*, and 28 days in *Americamysis bahia*). NOEC (litter size of normal individual in *Daphnia magna*, cumulative mortality rate, length, and number of eggs per female in *Americamysis bahia*)
- Algae (or other aquatic plants):
  - Algae: 72 or 96 hours, NOEC (growth inhibition)
  - Other aquatic plants: 7 or 14 days, NOEC (growth inhibition)
b) Requirements for usable data

In principle, when aquatic environmental hazard levels are above the water solubility, the data shall not be used for classification.

As for the concept of hazard evaluation for unstable substances with hydrolysis (handling of hazard of degradation products), or poorly water-soluble substances (handling of toxicity levels over water-solubility), refer to descriptions regarding difficult to test substances in the UN GHS 4th revised edition Annex 9. When almost all of the parent substance is degraded for the duration of the test and the remaining degradation products are recognized to be toxic, the toxicity of the degradation products are considered to be that of the parent substance (as for handling of degradation products, refer to the UN GHS 4th revised edition Annex 9 A9.2.6.3). In such cases, it is preferable to note that the classification is based on the hazard especially from the degradation products.

In principle, data according to GLP shall be used. Nonetheless, even if it is not clear whether a test is conducted in according to GLP, if an expert judged that data are reliable based on test conditions, etc., the data shall be adopted. When there is hesitation about decision, judgment by experts shall be sought for a final decision.

For individual species, see below. As for any reliable data (e.g. List 1) without indication of accordance with the test guidelines below, data shall be adopted in which organism species, exposure time, and endpoint corresponds to those stipulated in the test guidelines.

■ Fish:

Chronic or long-term toxicity tests using fish shall be conducted according to OECD Test Guideline 210 (Fish early life stage) (Note 1), Fish Life Cycle Test (US EPA 850.1500), or equivalent (one- or two-generation test).

The appendix to OECD Test guideline 210 defines exposure time for each species (for example, the case of Oryziatidae, up to 30 days (at minimum 28 days) after hatching), while a Fish Life Cycle Test (US EPA850.1500) provides no definition on the duration. Accordingly, for data requiring confirmed reliability, the exposure time adopted is considered to be appropriate if the compliance to OECD Test Guideline 210, the Fish Life Cycle Test, or corresponding test methods is clearly noted.

Endpoints are based on hatching success rate, growth (length and weight changes), time to first brood and number of offspring produced per female in OECD Test Guideline 210. In US EPA850.150, they are influence on reproduction (number of eggs and frequency of spawning), mortality rate, behavior, physiologic and pathological effects.

(Note 1) OECD test guideline 210 is sub-chronic test, but the test results, which can be
a good index for chronic toxicity, may be used as chronic aquatic toxicity data.

■ Crustacea:

Chronic toxicity tests using crustacea shall be conducted in accordance with OECD Test Guideline 211 (Daphnia magna Reproduction Test), US EPA OPPTS 850.1050 (Mysid chronic toxicity test), or their equivalent (NOECs of 21 days for Daphnia, NOECs of 7 days or more for Ceriodaphnia).

Endpoints are time to first brood and normal cumulative number of offspring (reproductive output).

■ Algae (or other aquatic plants):

Chronic tests using Algae, OECD Test Guideline 201 (2006 revision) is a growth inhibition test for algae and cyanobacteria (cyanophyceae). In principle, growth inhibition (NOEC) by growth rate method is used for an endpoint.

When it is not clear whether growth rate method or other method is used for concluding NOECs, the NOECs may be tentatively used.

Most often used other aquatic plants are Lemma gibba and Lemma minor. Expert judgment should be used to decide if obtained NOEC can be treated the same as other chronic toxicity data of algae.

3) Data on bioaccumulation and rapid degradability

a) Requirements for usable data

Data on bioaccumulation (BCF, log K_{ow}), rapid degradability (bio degradability, hydrolysis, etc.) shall be based on test methods specified by the Chemical Substances Control Law, OECD Test Guidelines, ASTM Standard Test Methods, etc., and they are deemed as reliable. In principle, data according to GLP shall be used. If, however, it is not clear whether a test is according to GLP, if an expert judged that data are reliable based on test conditions, etc., the data shall be adopted.

i) Data on bioaccumulation

As for data on bioaccumulation, when measured BCF values in fish are available, such as data for degradability of existing chemical substances by microorganisms, concentration in fish, etc., they should take precedence, but results based on the properties such as low concentration cannot be directly used. If measured BCF values are not available, measured log K_{ow} values are used as benchmarks. When measured log K_{ow} values are not available, or they are considered to be not reliable, estimation of log K_{ow}
obtained by validated method\textsuperscript{22} such as QSAR cannot be used as an evidence of classification but written in as reference information, preferably.

Results from the following types of tests or corresponding tests may be accepted.

OECD Test Guideline 305 and the former 305A-D (BCF)
OECD Test Guideline 107 and 117 ($K_{ow}$)

When test results described above are not available, test results ($K_{ow}$) from OECD Test Guideline 123 and the corresponding tests may be adopted under an expert's judgment.

ii) Data on rapid degradability

Both biotic and abiotic degradability (for example, hydrolysis) must be taken into account. In case BOD degradability rate exceeds 60\% or TOC degradability rate exceeds 70\% in the ready biodegradability test, the substance is considered as rapidly degradable. A substance of which the test result based on oxygen consuming amount or carbon dioxide production amount exceeds 60\%, or of which the test result based on dissolved organic carbon exceeds 70\%, and which has been determined as readily degradable in the Existing Chemical Substance Evaluation according to the Chemical Substance Control Law, may be determined as rapidly degradable in GHS classification. When the decision result of “hardly degradable” is applied to GHS classification, other degradability data must be taken into account. If these test results are not available, the prediction results by use of biodegradability prediction software\textsuperscript{23} cannot be used as an evidence of classification but it is preferable that the results are written in as reference information. The prediction results can be utilized only for a decision that the substance is not rapidly degradable.

When data on rapid degradability are not available, the substance is assumed to be without rapid degradability.

Results from OECD Test Guidelines 301A-F(readily degradability test) and the corresponding tests may be accepted.

When test results described above are not available, results from the following types of tests and the corresponding tests may be adopted under an expert's decision.

C) Order of precedence when multiple Data exist

1) When reliable information source (such as List 1) is available:

\textsuperscript{22} An example of log $K_{ow}$ (biodegradability) prediction software:
http://www.epa.gov/opptintr/exposure/pubs/episuitedl.htm

\textsuperscript{23} An example of biodegradability prediction software: BIOWIN (EPI Suite)
http://www.epa.gov/opptintr/exposure/pubs/episuitedl.htm
a) Data from tests conducted according to internationally recognized test guidelines (such as OECD) and GLP take precedence.
b) When data falling under 1) are not available, data from tests conducted according to internationally recognized test guidelines (such as OECD) whose compliance to GLP is not clear take precedence.
c) When classification of data based on reliability as shown in 1) and 2) is not possible, the latest data take precedence.
d) If there are multiple data with the same reliability, in principle the safer data (i.e., the smallest concentration for aquatic environment hazards, the highest value for bioaccumulation, the lowest value for rapid degradability) shall be adopted. When four or more data sets, however, are available for the same life stage, condition, and test period of the same species, their geometric mean shall be adopted as the representative data of the species.
e) When one set of data substantially deviates from others, it is recommended to review the original literature and to confirm reliability of the data set. In addition, confirm that the relevant information sources are the latest available.

2) When reliable information source (such as List 1) is not available:

a) Among data collected from other information sources (for example, information sources shown in List 2), data considered to be reliable (GLP-conforming data or data whose evidence are specified and assessed) are adopted. When there is hesitation about decision, judgment by experts shall be sought for where necessary.
b) In that case, it should be confirmed that assessment documents and database used are the latest available or that references cited are reliable.
c) Among data which experts judged to be reliable to a certain extent, the safer data (i.e., the smallest concentration for aquatic environment hazards, the highest value for bioaccumulation, the smallest value for rapid degradability) shall be finally adopted. However, when four or more data sets are available for the same life stage, condition, and test period of the same species, their geometric mean shall be adopted as the representative data of the species.

D) Comparison with conventional classification systems

Consistency with EU CLP classification is as follows:

Category: acute 1= EU CLP H400
Category: Chronic 1 = EU CLP H410
Category: Chronic 2 = EU CLP H411
Category: Chronic 3 = EU CLP H412
Category: Chronic = EU CLP H413

The definitions of EU DSD classification are almost in accord with GHS categories and presumed to be classified as follows:

Category: acute 1 = EU R50 (and R50/53)
Category: acute 2 = EU R51 (and R51/53)
Category: acute 3 = EU R52 (and R52/53)
Category: Chronic 1 $\equiv$ EU・R50/53
Category: Chronic 2 $\equiv$ EU・R51/53
Category: Chronic 3 $\equiv$ EU・R52/53

The definitions of R50, 51, and 52 correspond with Categories: Acute 1, Acute 2, and Acute 3 of (acute) aquatic environmental hazards in GHS classification, respectively. Unlike GHS, the differences are that Crustacea is limited to Daphnia, and that the testing time for algae is fixed at 72 hours in EU DSD. The requirement for R53 is log $K_{ow} \geq 3.0$ or BCF $> 100$, and is slightly wider than that in GHS classification. Moreover, test data serving as evidence are not sufficiently published, and some of them appear to be determined based on structure-action relationship or data of analogous substances. Accordingly, its data on biodegradability and bioaccumulation should be confirmed. In addition, it should be noted that R-Phrases are often added and revised. Consequently, R-Phrases are only used as reference for GHS classification.

In EU DSD classification, many of substances categorized in aquatic toxicity are ELINCS substances (only registered companies can produce and import) for which base set tests have been conducted, and information on EINECS substances for general use is relatively limited except for that of agrochemicals.
4-2-2 Hazardous to the ozone layer

(1) Definitions
Definitions of hazardous to the ozone layer in UN GHS are as follows, and they are adopted in this guidance.

【UN GHS 4th revised edition】 (4.2.1)
Ozone Depleting Potential (ODP) is an integrative quantity, distinct for each halocarbon source species, that represents the extent of ozone depletion in the stratosphere expected from the halocarbon on a mass-for-mass basis relative to CFC-11.
The formal definition of ODP is the ratio of integrated perturbation to total ozone, for a differential mass emission of a particular compound relative to an equal emission of CFC-11.
Montreal Protocol is the Montreal Protocol on Substances that Deplete the Ozone Layer as either adjusted and/or amended by the Parties to the Protocol.

(2) Classification criteria
A) Classification criteria according to Classification JIS
Chemicals shall be classified as hazardous to the ozone layer, Category 1 according to the following classification criteria:
“Any of the controlled substances listed in Annexes to the Montreal Protocol; or any mixture containing at least one ingredient listed in the Annexes to the Montreal Protocol, at a concentration ≥ 0.1%”

B) Classification criteria in UN GHS (reference information)
Classification JIS and UN GHS classification adopts the same classification criteria.

(3) Comparison with conventional classification systems
Classification criteria in EU CLP and EU DSD, classification criteria correspond to those of Classification JIS and UN GHS.
A substance applicable to EU CLP H420 and R59 in EU DSD corresponds to Category 1 of Classification JIS and UN GHS.

(4) Classification criteria for substances hazardous to ozone layer
A substance shall be classified with regard to hazards to ozone layer in accordance with the below classification criteria.
Table 4-2-2-1 Criteria for substances and mixtures hazardous to the ozone layer

<table>
<thead>
<tr>
<th>Category</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Any of the controlled substances listed in Annexes to the Montreal Protocol; or any mixture containing at least one ingredient listed in the Annexes to the Montreal Protocol, at a concentration ≥ 0.1%</td>
</tr>
</tbody>
</table>

<tr>
<td>R51/53</td>
<td>Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment</td>
</tr>
<tr>
<td>R52</td>
<td>Harmful to aquatic organisms</td>
</tr>
</tbody>
</table>
R52/53 Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment
R53 May cause long-term adverse effects in the aquatic environment
R59 Dangerous for the ozone layer
R60 May impair fertility
R61 May cause harm to the unborn child
R62 Possible risk of impaired fertility
R63 Possible risk of harm to the unborn child
R64 May cause harm to breast-fed babies
R65 Harmful: may cause lung damage if swallowed
R67 Vapours may cause drowsiness and dizziness
R68 Possible risk of irreversible effects
